INDUSTRY DIVISION

Roger H. Bugenhagen, Chief

ACKNOWLEDGMENTS—Many persons participated in the various activities of the 1977 Census of Manufactures. Primary direction of the program was performed by **Shirley Kallek,** Associate Director for Economic Fields, and **Richard B. Quanrud,** Assistant Director for Economic and Agriculture Censuses (until July 1981).

This report was prepared in the Industry Division under the general direction of **Milton Eisen,** Chief (until February 1980), and **Roger H. Bugenhagen,** his successor. **Arthur W. Horowitz,** assisted by **John S. Berube,** was responsible for overall management of the census and was the Division's liaison officer with other divisions.

Program responsibility was shared by the following individuals who participated importantly in the entire program. **Dale W. Gordon,** Census Durables; **Michael J. Zampogna,** Census Nondurables; **Ruth A. Runyan** (until May 1978), and **John P. Govoni,** her successor, Census Subject Reports; **Paul F. Berard,** Current Durables; **Robert J. Nealon,** Current Nondurables; and **John P. McNamee,** Minerals.

Edward A. Robinson made significant contributions to the basic economic concepts and content of the census. The mathematical techniques used in sampling the respondents were developed by **Donald F. Clark,** assisted by **Preston J. Waite, Gary L. Kusch, Stacey Cole,** and **Marlene Altman. Kenneth I. Hansen,** Chief of the Annual Survey of Manufactures Branch, assisted by **Robert Rosati** and **Stephen Raley,** was responsible for the annual survey component of the census of manufactures. Specifications for the complex computer edit were the responsibility of the staffs of the Statistical Methods and Annual Survey of Manufactures Branches. Computer programs were prepared under the direction of **Howard N. Hamilton** (until November 1978), and **William Norfolk,** his successor. Assisting were **Mary H. Johnson, Sarah W. Mathis, George Anderson, Gerald Turnage, David L. Onions, Robert Brown, Mark I. Kronisch,** and **Barbara Lambert.**

Systems and procedures for mailout and clerical processing were developed in the Economic Surveys Division by **Roger H. Bugenhagen,** Chief (until February 1980), assisted by **Andrew L. Grieco, Robert E. Crowther,** and **Joel Richardson.** Clerical procedures were developed by **Robert Brand,** assisted by **Haydn R. Mearkle, Helen L. Barton,** and **Beverly M. Eng. Walter E. Neece,** assisted by **C. Harvey Monk,** had staff responsibility for industry classification procedures. Administrative record processing specifications were developed by **Lawrence A. Blum** and **John M. Sullivan** under the direction of **Samuel Schweid.** Electronic computer programs for check-in and administrative records were developed and supervised by **Robert G. Willner** and **Donald H. Danbury** under the direction of **Paul E. Poissant.** Data input procedures were developed by **Leonard M. Tauber** and quality control procedures by **Jean F. Biggs.**

Forms design was performed in the Administrative Services Division, **Henry J. Husmann,** Chief (until August 1980). The entire staff of the Forms and Mail Management Branch made significant contributions in planning, design, review, and composition of the forms.

Within the Publications Services Division, many individuals made significant contributions in publication planning and design, editorial review, composition, and printing procurement. These operations were performed under the direction of **Raymond J. Koski,** Chief, assisted by **Milton S. Andersen, Arlene C. Duckett, Gerald A. Mann, Helen M. Curtis, Jacqueline A. Gans, John Overby, Nicholas Preftakes, Rosemary B. Vance,** and **Robert Warunek.**

Clerical and data keying operations were performed in the Data Preparation Division at Jeffersonville, Ind., under the direction of **Don L. Adams,** Chief, assisted by **Robert L. Allen, Rebecca Lamon,** and **George Wilson.** The clerical geocoding effort was directed by **Wendell McManus.**

Computer processing was directed by **C. Thomas DiNenna,** Chief, Computer Services Division. **John E. Halterman, Jesse J. Verdeja, Willie E. Clark,** and **Norman W. Larsen** provided staff assistance.

Lawrence Cox, Statistical Research Division, and **Lawrence E. Cornish,** Systems Software Division, made significant contributions by developing special-purpose computer programs for disclosure analysis and publication preparation.

Donald E. Young, Lawrence H. Lyons, and **Robert S. Taylor,** of the Office of the Assistant Director for Economic and Agriculture Censuses, participated in overall planning and review of the census operations.

Special acknowledgment is also due the many industries whose cooperation has contributed to the publication of these data.

L. Product Group Reference List	L-1

Data in this volume may differ slightly from the industry and area reports previously published. These differences are due to corrections which were made for minor errors identified after the industry and area reports were issued. This volume reflects these corrections.

All errors identified in any phase of the review were carried to the computer file used to produce the final subject and special reports. Therefore, those represent the most accurate data available.

I. General Background

1. HISTORY OF THE ECONOMIC CENSUSES

General—The economic censuses provide a comprehensive statistical profile of a large segment of the national economy. This program includes censuses of manufactures, retail trade, wholesale trade, service industries, mineral industries, and construction industries. In 1977, these industries accounted for nearly 61 percent of the $1,894.5 billion of the gross domestic product and 70 percent of that originating in the private sector. The principal industry groups not covered were finance, insurance, and real estate; agriculture and forestry; communications; electric, gas, and sanitary services; and transportation. Limited information on transportation is collected, e.g., truck registration and distances travelled, and shipments of commodites by type of transport and distance shipped.

Uses and users of census data—The economic censuses are the primary source of facts about the structure and functioning of a major part of the economy. They are used extensively in compiling the benchmark measures of the national accounts. Census data also serve as weights or benchmarks for indexes of industrial production, productivity, and price; as well as many current surveys of industrial activity.

There is widespread use of the economic censuses, by the Government, in setting economic policy and monitoring economic programs. Manufacturers and distributors rely on census data to measure their potential geographic and industrial markets. The censuses provide the facts needed for economic forecasting; analysis of sales performance; the layout of sales territories; the allocation of advertising budgets; and the location of plants, warehouses, and stores. Trade and professional associations rely on census information to determine how their industries are changing; chambers of commerce and State and local governments depend on them to assess changes in the business structure in their areas. Business magazines and academic researchers rely on census facts as background for many of their articles.

Census reports are purchased by thousands of business and other users; census data are republished and widely circulated by trade associations, business journals, and the daily press; and census volumes are available in all the major public and college libraries.

History—The first economic type census covered the year 1809, when inquiries on manufacturing were included with the 1810 Census of Population. By modern standards, the results of this

pioneer effort would be considered unsatisfactory.[1] However, continued interest in the Nation's economic growth led to successive improvements in economic census-taking during the 19th century. By 1890, the statistical standards and procedures followed in censuses reached a full professional quality.

All of the decennial censuses from 1810 through 1940, with the exception of 1830, included questions on manufacturing. Inquiries on mining first appeared in 1840, and censuses of mineral industries were conducted decennially through 1940. Although some business-related data were collected in 1840, the first census of business was taken for the year 1929. This included retail trade, wholesale trade, and construction; beginning with 1933, selected service trades were covered. Dates of these and other economic censuses from 1809 are shown in table A.

Enterprise statistics—Through the history of the economic censuses. the unit of enumeration has been the establishment—i.e., a single physical location engaged in a specific line of business (for more discussion, see section 8). This unit is best suited for obtaining measures of direct output and input—labor, material, capital, etc. It is also best suited for providing refined industry and geographic tabulations. Statistics measuring overall income and balance sheet data are best collected at the company or enterprise level. In the early 19th century, these two business units were often identical. With the rise of large-scale operations, it became quite common for the large companies to operate separate manufacturing establishments in a number of diverse industries so that today the establishment and enterprise frequently are not the same. Enterprise measures and balance sheet data have typically been provided by the Internal Revenue Service (IRS) in its Statistics of Income and Federal Trade Commission (FTC) in its Quarterly Financial Report of Corporations.

The Bureau of the Census, as a result of the coordinated collection and tabulation of comparable data for several economic sectors in 1954, also developed an enterprise statistics

[1]Actual coverage varied from census to census. [2]Limited information only.

[1] For an appraisal of early censuses of manufacturing, see Meyer H. Fishbein, The Censuses of Manufactures 1810-1890. National Archives Publication No. 63-22, June 1963, Government Printing Office.

program. This program relates census company-level data to data measuring the activities of individual operating units or establishments within the companies. Thus, a measurement of the integration and diversification of the American enterprise system became available. The enterprise statistics program also made it possible to link census establishment-based data on a modified basis to enterprise-based statistical systems such as the IRS's Statistics of Income for Corporations.

Legal provisions—The periodic economic censuses are required by law. Title 13 of the United States Code specifies the frequency of the censuses, the kinds of activities to be covered, the obligation to report, the penalties for failure to report, and the confidentiality of returns. It also authorizes the use of sampling techniques in conducting censuses. As amended in 1964, Title 13 requires the economic censuses to be taken at 5-year intervals, covering the years ending in "2" and "7." The next censuses will cover the year 1982 and will include the census of agriculture, which has been customarily conducted on a different time sequence from the other economic censuses. The pertinent portions of Title 13 are quoted in appendix E.

2. CHARACTERISTICS OF THE INDUSTRIAL SECTOR

General—Manufacturing is the largest sector of the economy. In 1977, manufacturing plants employed nearly 20 million persons, or 20 percent of the civilian labor force of 97.4 million. As shown in table B, gross domestic product (GDP) originating in manufacturing averages almost 24 percent of the total. Wholesale and retail trade combined was the next largest sector with 17 percent of the GDP.

Cyclical changes—The need for frequent and comprehensive statistics on manufacturing derives as much from its sensitivity to cyclical influences as from its relative size. Cyclical changes in income originating in manufacturing tend to be relatively larger than in the economy as a whole, as can be seen in the movement of national income originating in manufacturing from 1929 to 1933 to 1939 in table C.

Within manufacturing, durable goods industries accounted for about 60 percent of all manufactures during recent periods. This category tends to be more volatile than nondurable goods,

[1]Gross national product is the market value of goods and services produced by labor and property supplied by residents of the United States. Gross domestic product is the value of goods and services attributable to labor and property located within the United States. It equals GNP less the "Rest of the world" which is the net inflow of labor and property income from abroad.

generally accounting for a smaller percentage of all manufactures during periods of contraction and a larger percentage during periods of expansion. In the early thirties, for example, as shown in table C, durable goods manufacturing fell to only about one-third of the total.[2]

Geographic distribution—In the early and middle 19th century, manufacturing activity was concentrated in the Northeast. Over the past 130 years, as shown in table D, there has been a steady decline in the proportion accounted for by the Northeastern States. Industry expanded into the north central region in the

[1]Gross national product is the market value of goods and services produced by labor and property of residents of the United States. Gross domestic product is the value of goods and services produced within the United States. National income is gross national product less capital consumption allowances, indirect business taxes, and business transfers plus subsidies less surplus of government enterprises.

Source: Survey of Current Business.

[2]Based on national income rather than gross domestic product (GDP). Industry detail for GDP is available only from 1947; whereas, industry detail for national income is available from 1929 and encompasses the very depressed period of the 1930's.

Table D. **Employment in Manufacturing Establishments by Region: 1849 to 1977**

Year	United States	North-east	North Central	South	West
	Number of employees (thousands)				
1977	19,590	5,008	6,272	5,593	2,717
1972	19,029	5,306	6,135	5,221	2,367
1967	18,492	5,573	6,059	4,553	2,305
1963	16,235	5,190	5,239	3,780	2,025
1958	15,423	5,242	5,017	3,382	1,779
1947	14,294	5,429	5,109	2,710	1,054
1939	9,527	3,879	3,184	1,852	612
1929	10,198	4,246	3,516	1,758	675
1899	5,077	2,629	1,474	793	181
1849	957	696	110	146	4
	Percent of U.S. total				
1977	100	26	32	29	14
1972	100	28	32	27	13
1967	100	30	33	25	12

latter part of the 19th century and, in more recent years, displayed a marked growth in the South and West.

Size distribution—Manufacturing activity tends to be characterized by relative large-scale operations. While there are many small manufacturing plants, they account for a relatively small part of the total output of goods. As shown in table E, over half of the plants covered in the 1977 Census of Manufactures were very small, employing less than 10 workers, but they accounted for less than 3 percent of total manufacturing activity as measured by value added by manufacture. (See appendix A for definition of value added).

Table E. **Number of Establishments and Value Added by Manufacture by Size of Establishment: 1977**

(Cumulative percentage)

Employment size class	Establishments	Value added by manufacture
All establishments	100.0	100.0
1 to 4 employees	40.1	1.0
1 to 9 employees	53.8	2.4
1 to 19 employees	67.6	5.2
1 to 49 employees	82.3	12.2
1 to 99 employees	89.9	20.5
1 to 249 employees	96.0	36.3
1 to 499 employees	98.3	51.0
1 to 999 employees	99.3	65.8
1 to 2,499 employees	99.8	80.1

3. CENSUS OF MANUFACTURES—BENCHMARK STATISTICS

In the farm-oriented economy of the early 19th century, the need for industrial statistics for setting government policy, except for tariffs and taxes, was slight. A few series on physical output of commodities originated either from private sources (flour, iron, steel, etc.) or as a byproduct of tax collection or other government functions (liquors, beer, tobacco products, etc.). The only sources of information on the growing manufacturing sector were the censuses of manufactures, then taken at 10-year intervals. Today, the need for industrial statistics has greatly increased so there is now a vast array of detailed information covering virtually every measurable aspect of industrial activity including employment; payrolls; hours worked; production; prices; inventories; orders; investment in structures, machinery, and equipment; and consumption of raw materials, fuels, and water. Many of these statistics are available at frequent intervals and very promptly after the close of the accounting period. Sophisticated indicators of economic change have also been developed, such as price and production indexes and the gross national product accounts that are published at monthly or quarterly intervals.

The census of manufactures, though conducted only at 5-year intervals, still plays an essential role since no other source measures the structure of the industrial sector in such a comprehensive and detailed way.

For every manufacturing plant with one employee or more, the census obtains data on its input of labor, materials, and capital; its output of products and services; its location; and the legal form of organization of the owning firm.[3]

A set of summary of general statistics are developed for each establishment (that is, total employment, payroll, number of production-worker hours and wages, cost of materials, value of shipments, inventories, capital expenditures, and value added by manufacture) and aggregated by industry, by area, by employment size of establishment, by degree of product specialization within plant, and by type of ownership. Reports are published on the detailed industrial characteristics of each State and large standard metropolitan statistical area (SMSA); and overall measures of manufacturing activity are shown at the county and individual city level provided the information can be published without compromising the confidentiality of individual company data. Since census legislation guarantees confidentiality to the firms that are required to report, it is frequently necessary to suppress some aggregates. Since a significant amount of industry detail cannot be published for the 3,140 counties and county equivalents in the United States, a special computer tape on Location of Manufacturing Plants was developed to provide a complete industry-county cross-section description of manufacturing. This tape includes the number of establishments in each of the 450 industries by county or county-equivalent area, by employment size. Comparison of this complete profile between censuses is used to study shifts in the geographic dispersion of industries and the industrial structure of local areas.

[3] Since 1967, some of this information for 120,000 small companies was not obtained directly but estimated from other government records. See the discussion of coverage of establishments in items 4 and 6.

The census of manufactures also facilitates the conduct of more frequent surveys on a sample basis. In fact, the present legislation specifying that censuses be conducted every 5 years authorizes an annual survey of manufactures (ASM) on a sample basis during the intervening years. The 5-year census provides the framework for selecting a new sample and the periodic universe levels to benchmark the sample estimates. The sample includes about one-fifth of all establishments. All large establishments are included in every sample; the smaller are selected proportionately to their size and are replaced at the end of each census. Thus, there is an annual updating of the census of manufactures in terms of broad measures of economic activity. The ASM contains the same basic measures of economic activity of the plant such as employment, payrolls, value of shipments, value added by manufacture, as does the census of manufactures, but obtains less detailed information on products, materials consumption, and equipment.[4]

The census of manufactures also is used to update other indicators of economic activity, especially the national income accounts. Census data on materials consumed and product output by industry are basic to the input-output matrix developed by the Bureau of Economic Analysis (BEA) for the manufacturing sector. The Federal Reserve Board's monthly Index of Industrial Production—a key indicator of current economic activity—relies on census industry and product data as benchmarks and weights to sum industries to higher levels of aggregation. The census and ASM also provide benchmarks for hundreds of monthly and quarterly surveys of commodity output conducted by the Bureau of the Census, other government agencies, and by manufacturers' associations.

4. INDUSTRY CLASSIFICATION OF ESTABLISHMENTS

Structure of the SIC System—The establishments in the census of manufactures are classified according to the SIC Manual. The SIC Manual covers the entire field of economic activities, subdivided as follows:

Industrial division	Title	Major groups
A	Agriculture, forestry, and fisheries	01-09
B	Mining	10-14
C	Contract construction	15-17
D	Manufacturing	20-39
E	Transportation, communication, electric, gas, and sanitary services	40-49
F	Wholesale and retail trade	50-59
G	Finance, insurance, and real estate	60-67
H	Services	70-89
I	Public administration	91-97
J	Nonclassifiable establishments	99

Below the major group level, the SIC provides for 3-digit groups and finally for 4-digit industries. To illustrate—

Division D—Manufacturing

Major Group. . . . . Food and kindred products
Industry group 202 . . . . . Dairy products
Industry 2023. . . . . Condensed and evaporated milk

The SIC system was developed to classify establishments as distinguished from similar systems used to classify companies or enterprises. An establishment is defined as a single physical location engaged in one of the industry categories of the SIC. (See pp. 1-9 for the application of this definition to collecting data in the economic censuses.)

This SIC system is the responsibility of an intragovernmental technical committee headed by the Office of Federal Statistical Policy and Standards, formerly part of the Office of Management and Budget, but transferred to the Department of Commerce in 1977. The system is used by all Federal Government agencies engaged in the classification of establishments. Many State and local governments and business concerns also organize their own records along SIC system lines in order to facilitate comparison with federal statistics.

The first SIC Manual was issued in 1939. For the manufacturing sector, the nucleus was the set of industry classifications developed over many years for use in the census of manufactures. A revised manual was issued for the manufacturing industries in 1945 and with minor modifications, used in the 1947 and the 1954 Censuses of Manufactures. In 1957, the SIC Manual was extensively revised for manufacturing industries and the historical comparability of some data was seriously affected. The introduction and appendixes to the 1958 census volumes discuss in detail this revision and its effects on census series. Only minor revisions of the SIC Manual were made between 1958 and 1967. The next extensive revision of the SIC Manual affecting the comparability of industry data was completed in 1972. These revisions and their impact on comparability appear in appendix C of the 1972 Census of Manufactures volumes.

Structure of the Manufacturing SIC System—For manufacturing, there are 20 2-digit SIC Major Groups (20 to 39) which are subdivided in 144 3-digit SIC Groups (201 to 399) and into 452 4-digit industries (2011 to 3999). The Bureau of the Census combined some small industries in order to publish data.

Most of the 452 manufacturing industries are defined in terms of specific groups of related products. Usually the products are made of similar materials and by similar processes and many are competitive but the SIC system does not necessarily bring together products which are close substitutes

[4] Since the ASM is based on a sample, the cross-classifications by industry and by area are fewer than in the census of manufactures. At the U.S. level, statistics are published in the annual survey for practically all of the 450 industries. However, at the SMSA level, statistics are published only for 3-digit and 2-digit industry groupings. At the county level, information is published for about 10 percent of the 3,140 counties and equivalent areas. These 300 odd counties are the larger ones in terms of manufacturing activity and account for about 80 percent of total manufacturing employment. Data for cities are shown for those cities having over 20,000 manufacturing employees.

in use and competitive in markets. In determining the boundaries of industries,[5] it is essential that each industry comprise a group of establishments that are highly specialized in making products that define the industry (primary products) and that a large proportion of all the products be made in establishments classified in the industry. While similarity of product is most frequently the determining factor in defining an industry, some industries are defined in terms of the processes or equipment used regardless of the final product of the establishment. (Example: Industry 3361, Aluminium Foundries (castings).) A small number of industries are basically defined by material used as well as final product of the plant. (Example: Industry 2521, Wood Office Furniture, and Industry 2522, Metal Office Furniture.)

There are wide differences among industries in their purity—i.e., the extent to which the establishments classified in the industry:

a. Account for the total production of commodities "primary" to the industry.
b. Produce products or services "belonging" to other industries (that is, secondary products).
c. Use similar materials or processes.

These variations are frequently construed to be shortcomings. However, these limitations in the classification structure arise from the inherent complexity of our economic system and from the variation in types of production that take place in individual establishments.

While the SIC system is the basis for aggregating census data, the data collected, in turn, provide the statistical basis for periodic critical evaluation of that classification system and its revision.[6]

No general-purpose system of industrial classification can satisfy all users of census data. Some business users are interested primarily in a narrow range of products which they and their competitors produce. Others are involved in a wide range of products that move through the same marketing channel. Others seek data relating to the consumers of one or more types of materials. Some are interested only in the data for highly specialized plants; others for plants producing a "full line" of products. Those studying productivity may require data for plants using the same techniques.

The large number of SIC industries provides the analyst with the "building blocks" for making useful approximations, even if specific data cannot be developed to resolve many of these problems. A single general-purpose system of classification can only partially satisfy these diverse needs; a point is soon reached at which the adaptation of a system to serve one use better will reduce its ability (sometimes disproportionately) to serve an alternative use.

Accordingly, users of data frequently reqroup detailed SIC industries differently from the 2- and 3-digit SIC categories. The Federal Reserve Board for many years has made combinations to stress such characteristics of products as durable, nondurable, consumer, producer, finished, intermediate goods, etc. Other public and private agencies also recombine the detailed classes. The 4-digit industries are more susceptible to allocation to such categories than the 2-digit SIC groups.

Subindustries—The Bureau of the Census frequently has further classified some of the basic 4-digit SIC industries into "subindustries." Subindustries are employed where there are wide disparities in the input-output relationships (or operating ratios) of the plants in the industry because of differences in the degree of vertical integration, technology, methods of distribution, geographic location, types of materials used, etc. In about 61 manufacturing industries, subindustries were established for editing purposes and many were regarded as significant enough to be used for publication. For example, the bakery industry (SIC 2051) is subdivided into wholesale bakeries, chain-store bakeries, home-service bakeries, and retail multioutlet bakeries; and many apparel industries (major group 23) are subclassified into manufacturers, contractors, and jobbers.

To provide a further measurement of variations with 4-digit industries, the Bureau of the Census also subclassified establishments by the degree to which they produce the primary products or specific classes of primary products of the 4-digit industry into which they are classified. This is, in effect, a subindustry classification based on the degree of product specialization which is published in table 5a of Volume II, Industry Statistics.

Definition of manufacturing—Manufacturing includes a wide range of activities as defined in the SIC Manual. Manufacturing is the mechanical or chemical transformation of inorganic or organic substances into new products. The assembly of component parts of products is also considered to be manufacturing if the resulting product is neither a structure nor other fixed improvement. These activities are usually carried on in plants, factories, or mills, which characteristically use power-driven machines and materials-handling equipment.

Manufacturing production is usually carried on for the wholesale market, for transfer to other plants of the same company, or to the order of industrial users. Typically, manufacturers do not sell directly to the household consumer, although some (for example, baking, milk bottling, etc.) sell, chiefly at retail, to household consumers through the mail, through house-to-house routes, or through salesmen. Some service-type activities (enameling, binding, platemaking, etc.) are included in manufacturing if they are performed primarily for trade; but are considered nonmanufacturing if they are performed primarily to the order of the household consumer. On the other hand, some manufacturing industries include business firms which perform only the entrepreneurial functions

[5] Frequently, business analysts and other data users look at a group of products from more than one point of view. For example, modern high-speed computers are classified as office machines. This describes the purpose of the product. In a physical sense, however, such computers would be described as electronic devices. Similarly, paper bags, wooden boxes, glass bottles, tin cans, and steel barrels may all be classified as containers, or they may be individually grouped with other products of similar materials, such as converted paper products, wood products, glass products, etc.

[6] See Industry Classification and Sector Measures of Industrial Production by James W. McKie, Bureau of the Census Working Paper No. 20, 1965, and Historical Comparability of Census of Manufactures Industries, 1929-1958 by Harold T. Goldstein, Bureau of the Census Working Paper No. 9, 1959.

of buying the materials and designing and marketing the product, but have the actual production done on contract (for example, apparel jobbers).

SIC classifies establishments—The SIC system is an establishment classification system, and the census of manufactures is conducted on an establishment basis. That is, a company with operations at more than one location is required to submit a report for each location. On the other hand, a company engaged in distinctly different lines of activity at one location is required to submit a separate report for each activity if the plant records permit such a separation and if the activities are substantial in size.

The requirement that distinct lines of activity at the same location be separately reported was applied only where the establishment produced and shipped significant amounts of products classified in different SIC industries. In widely varying degrees, many manufacturing establishments make products that fall into different SIC industries. Generally, the amounts involved are not significant enough to warrant the filing of separate reports, even if feasible. However, there are a number of locations at which large numbers of employees are engaged in activities defined in different industries of the SIC system. Frequently, companies organize their operations and their records separately for the diverse activities and report them as separate plants. When they do not do so on their own initiative, the Bureau of the Census requests separate reports if it appears that 100 or more employees are involved in each activity. For the most part, companies have cooperated and "split out" the different activities which would otherwise significantly distort the relationship of the industry and product statistics. Not infrequently, however, the two groups of products are made on the same production lines by many of the same employees and cannot be distinguished sufficiently in company records to provide establishment-type reporting.

The SIC system also recognizes special situations where otherwise separately classifiable activities frequently occur at one location. For example, the definition of Industry 2421, Sawmills and Planing Mills, recognizes that sawmills may include logging operations. Similarly, pulpmills operated in combination with papermills are included in one report.

Establishments included in census of manufactures—For the 1947 Census of Manufactures, the censuses have included only establishments with one employee or more. Prior to 1947, different criteria were used to determine if an establishment had to report in the census. In the censuses of 1921 through 1939, establishments with less than $5,000 value of products were excluded. For 1899 to 1919, the limit was $500. The change in the minimum-size criterion to an employment basis in 1947 did not appreciably affect the overall comparability of earlier census figures, except for the number of establishments.[7]

A sample survey of manufacturing plants with no paid employees was conducted in conjunction with the 1958 census. While there were nearly 52,000 establishments in this category in that year, they accounted for only about one-quarter of 1 percent of the total value of shipments of all manufacturing industries. The proportion was higher for certain industry groups such as lumber and wood products, and printing and publishing. Tabulation of IRS data for 1977 indicates that manufacturers with no paid employees continue to be of very minor importance. They contribute less than one half of 1 percent of the total value of shipments of all manufacturing industries.

Special treatment of very small establishments—Beginning with the 1967 census, an effort was made to relieve the very small establishments from the necessity of filing a census report. Approximately 145,000 small single-unit manufacturing firms identified as having less than 10 employees benefited from this procedure. Limited data on payrolls, sales, and industry classification from the administrative records of the Social Security Administration (SSA) and the IRS were made available to the Bureau of the Census for use in the 1967, 1972, and 1977 economic censuses. (These special arrangements safeguarded the confidentiality of both tax and census records.) Data other than payrolls and sales for these small establishments were estimated from historical industry ratios. The effect on industry aggregates is slight in most industries; for manufacturing as a whole, these small "administrative records" account for only 1.7 percent of the value added. Detailed product and materials data for these small establishments were not estimated; the entire value of product shipments and cost of materials was imputed to a "not specified by kind" (n.s.k.) category. If these establishments had been included in the 1972 Census of Manufactures, they were assigned the industry classifications to which they had been coded. If they had started business later, they were coded on the basis of brief descriptions of the general activity of the establishment as reported to the SSA. Where the description is incomplete or there are relatively fine lines of demarcation between industries or between manufacturing and nonmanufacturing activity, the code assigned to an establishment could differ from that which would have been assigned on the basis of more complete product information. Therefore, the Bureau of the Census conducted a special classification survey in order to clarify the industry codes of some of the establishments in the adminstrative record file. All establishments without specific 4-digit codes and those where there could be significant misclassification between manufacturing and other sectors were sent such a questionnaire. Nevertheless, the total establishment counts in most industries should be viewed as approximations rather than precise measurements. The counts for establishments with 20 employees or more are far more reliable than the total number of establishments.

Auxiliary units—Manufacturing requires a wide range of diverse support activities. These activities include movement to the manufacturing plant, storage, the operation and maintenance of plant and equipment, the design of flow of work through the production process, and necessary arrangements for shipment of output to customers. Also included are a host of subsidiary activities associated with the operation of an establishment (for example, management and policy formation, product and market orientation, engineering and quality control,

[7] This point is discussed at greater length in the Introduction to the 1947 volumes.

recordkeeping and accounting, physical security of plant and equipment, and the like).

Support and subsidiary activities may be performed by personnel located at the manufacturing establishments or at a separate location serving one or more manufacturing locations of the same company. These separate locations are referred to as administrative offices and auxiliaries, where these activities are carried on at a different physical location or are performed for more than one plant, they are excluded from the figures for operating manufacturing establishments and are included in the data shown for administrative offices and auxiliaries. (See the description of the questionnaire used for these establishments, form NC-X6, in item 7.)

Border-line activities—The following types of activities, while having some of the characteristics usually found in manufacturing, are considered as nonmanufacturing and, therefore, are excluded from the census:

a. Processing on farms when the raw materials are grown on the farm and the manufacturing activities (poultry dressing, milk and butter production, logging, etc.) are on a small scale without extensive use of paid labor. Also custom milling, egg hatching, cotton ginning, and similar activities closely associated with agriculture are excluded.
b. Mineral preparation such as the crushing, screening, and concentrating of ores. However, mining performed as a secondary activity in conjunction with manufacturing is included in the census unless a separate report for the mining activity was filed; for example, stone and clay mining at cement, lime, and clay products plants.
c. Custom work to the individual order of household consumers. Examples are custom tailoring, woodworking, lettering on monuments, setting of diamonds, and the making of orthopedic appliances.
d. Repair and other service activities, except specified services performed "for the trade." Repair shops of railroads are also excluded.
e. Production of coke "for own use" by establishments owned by public utility companies.

Census establishment-based data measures manufacturing as primary activity. In the census of manufactures, no attempt is made to measure the extent of manufacturing at locations which are not primarily manufacturing plants, such as retail establishments which sell most of their products on the premises directly to household consumers (retail bakeries,[8] ice cream stores, etc.), or manufacturing by construction contractors at the site (for example, production of paving mixtures).

Conversely, it is not unusual for manufacturing establishments to engage also in some nonmanufacturing activities such as repair work, merchandising of products without further processing, and installation work. Ordinarily, these nonmanufacturing receipts are small in relation to the manufacturing activities and, therefore, it is not difficult to determine that the establishments should be included in the manufactures area. However, if the nonmanufacturing activities account for a significant proportion of total receipts of an establishment, the classification of that establishment into the appropriate major economic sector is more difficult.

In the economic censuses, an establishment engaged in a combination of manufacturing and merchandising is assigned either to the manufacturing or the trade industries depending on which of these activities was estimated to account for the larger share of its "value added" or "income produced." This criterion, even though based on approximation, was considered preferable to treating each dollar of receipts from each type of activity equally in determing the primary industry, since manufacturing requires considerably more worker-hours, salaries and wages, and capital inputs per dollar of receipts than either wholesaling or retailing. However, in classifying establishments engaged in manufacturing and also in mining, repair work, installation, construction, or other nonmanufacturing services, dollar receipts were used as the basis of classification because these activities require substantially comparable input per dollar of receipts.

Product codes—The SIC coding system is designed to describe industries and operates in such a way that the definitions become progressively narrower with successive additions of numerical digits. There are 20 very broad 2-digit groups, 144 3-digit groups, and 452 4-digit industries. Based on the SIC Manual, the Bureau of the Census has developed a product coding system along similar lines which contains about 1,500 5-digit product classes and approximately 13,000 individual 7-digit products. (See "the classification of products and materials" below.) The 7-digit products and 5-digit product classes are considered the primary products of the industry with the same first four digits as the product code. For example, the 7-digit product code number 2023212 refers to canned evaporated milk. The first five digits of this code number, 20232, refer to the "product class" canned milk, and the first four digits, 2023, refer to the industry in which these products are made (the condensed and evaporated milk industry). The same system is applied to the coding of materials. The first four digits of a material code (for example, the code number 024111, whole milk used as a material) describe the industry that produces it; e.g., 0241, agricultural industry, dairy farms.[9]

This SIC-based system is simpler than other systems for the coding of industrial products and materials used, since there is a direct numerical relationship between commodities and industries. Complications occur in the few SIC industries defined in terms of processes or equipment used as well as products made. As an example, women's sweaters are produced in knitting mills (industry 2253) and also in cut-and-sew shops (industry 2339). To retain the industry-of-origin concept, therefore, it is necessary to assign different product code numbers to women's sweaters, depending on where they are made.

The SIC-based commodity classification is used in the Bureau of the Census' entire industrial statistics program, including

[8] Separate data for retail bakeries with baking on the premises were included in the retail census publications.

[9] See tables 6a and 7 in volume II.

monthly, quarterly, and annual surveys, and also in the census of wholesale trade. The Bureau of the Census also publishes data on imports and exports in terms of SIC-based categories as well as the traditional Schedule B and TSUSA systems.[10]

Primary and secondary products of establishments—An establishment is classified in a particular industry if its production of the primary products of that industry exceeds in value its production of products of any other single industry. The industry code assigned to the establishment is derived from a summation of values for 7-digit product codes to their 4-digit industry and the selection of the largest 4-digit value as the establishment's industry classification. However, as mentioned earlier, the industry classification of an establishment may be determined not only by the products it makes but also by the processes employed or materials used in making those products.

While some establishments produce only the primary products of the industry in which they are classified, it rarely happens that all the establishments in an industry specialize to this extent. Therefore, the general statistics (employment, payrolls, inventories, value added by manufacture, total value of shipments, capital expenditures, etc.) shown for an industry (tables 1 to 4, Volume II, Industry Statistics) encompass not only the primary activities of the establishments in that industry but also their secondary activities. On the other hand, the product statistics in tables 5a and 6a of the industry chapters measure the total output of specific products whether they are produced by establishments classified in the same industry as the product or not. For this reason, in relating the general statistics of an industry, especially the industry total value of shipments (tables 1 to 4 in Volume II, Industry Statistics), to the product statistics (table 6), the composition of the industry's output as shown in tables 5b and 5c should be considered. Table 5c is a matrix table in which the columns break down industry shipments into primary and secondary products and "miscellaneous receipts." The rows of the table show the amount that each industry produced of a given product class.

The extent to which industry and product statistics may be matched with each other is measured by the two ratios shown in table 5b which are computed from table 5c. The first of the ratios, called the primary product specialization ratio, is the proportion of product shipments (both primary and secondary) of the industry made up of primary products. The second, defined as the coverage ratio, is the proportion of primary products shipped by the establishments classified in the industry to total shipments of such products by all manufacturing establishments.

Degrees of integration—In many industries, establishments use a wide variety of processes and materials to make the products of the industry. An industry classification based on end products may include establishments which are vertically integrated and those which put only the finishing touches on an already highly-fabricated purchased item. For example, in the refrigeration industry, there are some establishments that are almost completely integrated, producing the compressor and condensing unit, electric motor, and even the castings for those intermediate products, as well as the stamping of the case and the final assembly. In other plants, the condensing unit, the motor, and the case may be purchased and merely assembled into the finished product.

In some instances, nonintegrated plants have been placed in separate industry categories from the integrated plants. In many industries, the census provides separate statistics on departmental operations or on the production of intermediate commodities made and used in the producing plant. When an industry includes plants which ship a significant proportion of their output to other plants of the same company, separate figures are usually shown on the interplant transfers.

These differences in the integration of production processes, types of operations, and types of materials used, should be taken into account when relating the general items (employment, payrolls, value added, etc.) to the product and materials data. Where integrated operations are of consequence in an industry, that fact is pointed out in the explanatory text.

Industry code resistance—The production of many establishments is so evenly divided among two or more industry-determining product groups that the industry codes could change from year to year (industry codes can be based on less than half of the total value if there are three or more groups). In the ASM, plants had always been prevented from shifting back and forth among industries due to minor shifts in product mix in the years between censuses by the application of a "resistance formula" in assigning industry classifications. In census years, such resistence was not applied.

A resistance formula of the ASM type was first used in the 1963 Census of Manufactures. In the 1977 census, the formula was applied only to establishments included in the 1976 ASM sample panel with certainty (that is, included with a probability of "1"). In general, these certainty cases were establishments of companies with at least one manufacturing plant with 250 employees or more.

The formula recognizes the conflicting need to maintain continuity in the establishment composition of an industry to measure change and the need to allow establishments to be reclassified to measure the current composition of the industry.

In the 1977 census, the industry classification of a certainty establishment was allowed to change from that assigned in 1976 under one of the following conditions:

a. The value of the 1977 primary products constituted 60 percent or more of its total value of product shipments.

b. The value of the 1977 primary products, while less than 60 percent of the total, was at least twice the value of products which had determined the 1976 industry code.

c. The value of the 1977 primary products, while not meeting either of the two above conditions, had been the largest group of products for at least two years, i.e., exceeded the value of the 1975 primary industry's products in both 1977 and 1976 by at least 20 percent.

[10] Schedule B is the U.S. export classification while TSUSA is applied to imports.

Table F. **Value Added by Manufacture for Regions, Divisions, and States: 1977**

Region, division, and State	Value added by manufacture (million dollars)	United States, total (percent)	Region, division, and State	Value added by manufacture (million dollars)	United States, total (percent)
United States[1]	585,165.6	100.0	South Region--Con.		
Northeast Region	138,746.4	23.7	South Atlantic Division--Con.

District of Columbia	610.2	.1	California	54,862.4	9.4
Virginia	10,882.0	1.9	Alaska	504.2	.1
			Hawaii	785.5	.1

[1]Total value added differs slightly from summation of the individual States since a few establishments that could not be accurately coded to a State are included in the United States total.

5. GEOGRAPHIC CLASSIFICATION

Census divisions and regions—The 1977 Census of Manufactures measures industrial activity at the State, county, city, and standard metropolitan statistical area levels. In prior censuses, similar information was also provided for the traditional nine geographic divisions (e.g., New England, Middle Atlantic, etc.) and the four geographic regions (northeast, south, north central, and west).

The presentation of data for individual industries and industry groups at all these geographic levels has always created serious problems in protecting the confidentiality of individual company data. Consequently, it has frequently been necessary to set priorities as to what will be published (see item 21). In the past, the preference was given to publishing data for the broad geographic regions over States leading to greater suppression of industry detail at the State level. In recent years, there has been increasing interest in State information in preference to the broader regions. As a result, the 1977 Census of Manufactures gave first precedence to publishing State figures. A decision was also made to forego publication of any divisional and regional totals. This was desirable to avoid suppressing industry detail in one State that could have been published, in order to protect data for another State in the same division, that had to be suppressed to preserve the confidentiality of a respondent's figures.

Thus, some summary tables for the nine geographic divisions and four regions that were published in prior censuses do not appear in Volume III, Area Statistics, of the 1977 Census of Manufactures. (See table F for 1977 value added data for regions, divisions, and States.)

Standard metropolitan statistical areas—In addition to the data for the legally constituted geographic units (States, counties, and cities), all manufacturing totals are shown for approximately 280 SMSA's.[11] In the 1977 tables, detail for 2-, 3-, and 4-digit industries is shown for an SMSA if data for individual companies would not be disclosed, and the industry had at least 250 manufacturing employees. These are the same criteria as those used in the 1972 census. In censuses prior to 1967, detail had not been shown for SMSA's with under 40,000 total manufacturing employment, and only industry group figures were shown for SMSA's with 40,000 to 190,000 employees.

SMSA's are integrated economic and social units with a large volume of daily travel and communication between the central city (having 50,000 or more population) and outlying parts of

[11] See appendix F for a description of each SMSA.

Table G. **The 50 Largest SMSA's Ranked by Value Added by Manufacture: 1977 and 1972**

Standard metropolitan statistical area	Number of employees (thousands)	Value added by manufacture (mil. dol.)	1977 rank	1972 rank	Standard metropolitan statistical area	Number of employees (thousands)	Value added by manufacture (mil. dol.)	1977 rank	1972 rank

Seattle-Everett, Wash	131.9	4,161.0	25	28					
Kansas City, Mo.-Kans	117.8	4,119.9	26	21					

Note: The Flint, Mich., SMSA, falls within the top 50 SMSA's but is excluded from this table to avoid disclosing figures for individual companies.

[1]Not in the top 50 SMSA's. [2]New Kent County added in 1977.

the area.[1 2] Each area (except in New England) consists of one whole county or more. An area may contain not only highly industrialized counties but also adjoining counties which, though primarily residential in character, contribute significantly to the industrial counties' labor force and are socially and economically integrated with the central city. These areas were defined by the Federal Committee on Standard Metropolitan Statistical Areas for general-purpose use in presenting economic and social data. In the New England States, similar integration criteria have been applied in defining SMSA's, but on a city and town basis, because towns are regarded as the significant unit in this region of the country.

The requirement that each SMSA consist of county units (except in New England) sometimes results in the inclusion in an area of a considerable amount of territory which would not ordinarily be considered "metropolitan," much less "industrial." It is recognized that metropolitan areas could be more accurately defined in terms of smaller area segments such as minor civil divisions, but the usefulness of areas so defined would be limited by the fact that many types of economic and social data are available only on a county basis. Periodically, the SMSA's are redefined. While some changes can be made at any time, if there are serious reasons, the major restructuring of SMSA's occur after each census of population is completed. Appendix F describes the current SMSA's and the changes since 1972.

Each SMSA is designated by the name of the principal city of the area. In addition to the name of the principal city, the areas title may include one or two additional city names.

Value added by manufacture in all SMSA's accounted for 79 percent of the U.S. total in 1977. The relative importance of the 50 largest SMSA's in 1977 and their rankings in the 1972 and 1967 censuses are shown in table G.

[1 2] Each SMSA must include either (1) a city with 50,000 or more inhabitants, or (2) a city having a population of at least 25,000 which (a) with the addition of the population of contiguous places has a population density of at least 1,000 persons per square mile; (b) constitutes, for general economic and social purposes, a single community with a combined population of at least 50,000; and (c) includes a total population of at least 75,000 in the county or counties in which the city and contiguous places are located.

Standard consolidated statistical areas (SCSA's)—In many highly urbanized areas of the country, SMSA's tend to border on one another. For some purpose, it was desirable to treat them as one geographic area and the SCSA's were developed. Each SCSA includes two or more contiguous SMSA's which meet specific criteria of size, urban character, integration, and contiguity of

urbanized areas. As with the SMSA's, the SCSA's are defined by the Federal Committee on SMSA's of the Office of Management and Budget. Their number has increased from two in the 1972 census to 13 for 1977. All manufacturing totals appear in table 4 of each State chapter. Data for 2-, 3-, and 4-digit industries with 250 manufacturing employees or more are published in table 6.

Industrial counties—In addition to industry statistics for SMSA's, table 7 of each State report presents data by county for each industry group (2- and 3-digit) and industry (4-digit) that had at least 450 manufacturing employees if it would not disclose figures reported by individual companies.

Cities with 450 manufacturing employees or more—Summary totals and industry detail at the 2-, 3-, and 4-digit levels are shown for individual cities with 450 manufacturing employees or more, provided the data do not disclose information for individual companies.

II. Methods

6. PLANNING AND PREPARATION

General—The Bureau of the Census has an obligation to meet public needs for timely and reliable information while holding costs and the burden on respondents to a minimum. During the planning stages of each economic census, the advice of trade and professional associations, Federal and State government agencies, individual companies, labor unions, and research and educational organizations is sought in an effort to reach both the users of data and the respondents who supply the basic figures. Simultaneously, the problems encountered in the previous censuses are studied, and improved methods of collection, processing, and tabulation are explored.

Mailing lists—Beginning with the 1954 economic censuses, the basic mailing lists have been obtained from IRS and SSA records. These records were also sampled to develop statistics for retail and service establishments with no employees. After the 1963 censuses, feasibility studies indicated that greater use could be made of the data in the IRS-SSA records. In the 1967 censuses, over 2,000,000 firms were exempted from the filing requirement, including 120,000 small manufacturers. Instead, census-type statistics for this group were developed from IRS-SSA records. In close cooperation with IRS and SSA, specific procedures for the use of individual tax returns that assured confidential treatment of them were developed and set forth in Executive Order No. 10911, dated January 17, 1961, and Treasury Decision No. 6547 of the same date. The records used were business income tax returns (IRS forms 1040C, 1065, 1120, and 1120S) and payroll tax returns (IRS form 941). The name and address, payrolls, and gross business receipts were obtained from these reports, in addition to the SIC industrial activity code assigned by SSA. Other census statistics for these small firms were imputed using industry average ratios of the data item to payrolls and sales.[13]

This procedure was repeated in the 1972 and 1977 economic censuses. In 1972, there was a concerted effort by the Bureau of the Census to improve the industry coding of the administrative record by mailing a nature-of-business inquiry to establishments whose industry codes could have been affected by the 1972 revision to the SIC Manual. A similar effort was made in 1977 to clarify the classification of firms which SSA had not been able to code precisely.

Content of questionnaires—As in previous censuses, the content of the 1977 questionnaires was developed in consultation with a large number of organizations and individuals, representing both the manufacturers who supply the data and those who use the statistics. Those consulted included Government agencies, individual firms, labor unions, the American Statistical Association, the American Economic Association, the American Marketing Association, the National Association of Manufacturers, and all National Manufacturers' Associations covering specific industries.

Many individual manufacturers and their trade associations were consulted about the content of the sections of the report forms dealing with the output of specific products. Drafts of the proposed 1977 product sections were circulated among 800 trade associations and about 4,000 manufacturing companies, both large and small. These draft report forms included new product detail reflecting suggestions received by the Bureau of the Census after the 1972 canvass. Small items (those valued at $7.5 million or less) were not retained in the list unless they were needed to assure correct classification of other products or were of strategic importance. A restriction was placed on proposals for additional detail; it was stipulated that the 1977 value of any new product category should exceed $20 million. The manufacturers were requested to comment specifically on the availability of the data requested in their ordinary records, and the appropriateness of the product descriptions and units of measure.

The thousands of comments and suggestions received in this clearance procedure and the decisions reached were forwarded to the Office of Federal Statistical Policy and Standards, along with the product sections developed by the Bureau of the Census as a result.

A final review was made by the Office of Federal Statistical Policy and Standards with the assistance of the Advisory Council on Federal Reports. The latter organization is a group of business executives such as controllers, economists, and market research directors, representing a cross section of all industries.

[13] As discussed elsewhere in this introduction, the amount of imputation introduced by this procedure was only about 1 percent of the overall totals.

7. REPORTING FORMS

A representative selection of the reporting forms used in the census is reproduced in appendix D. The users of each of them are discussed below.

General forms—These forms were used in the economic censuses, generally, either as companywide reports or as reports for establishments whose classification was not known precisely in advance of mailing.

NC-X1, Report of Company Organization—This companywide report was used prior to mailing the 1977 census questionnaires to develop the directory of establishments operated by multiunit companies. A more detailed account of their use is given in Section 8, The Mailing Lists.

NC-X2, Listing of Additional Establishments—This form was included with the census of manufactures forms mailed to multiestablishment companies in order to obtain a list of establishments that were acquired after the NC-X1A was filed. These additional plants were classified, added to the NC-X1A directory list, and mailed the appropriate 1977 economic censuses report forms. Plants under construction but not in operation were requested to report the value of construction put in place during 1977 and the total gross book value of assets in place at the end of the year.

NC-X3, General Schedule—This questionnaire was designed to obtain information from small companies for which the industry code available in the SSA records was not precise enough to indicate which one of the standard census questionnaires should be mailed. The information provided on form NC-X3 was used to classify these companies by industry and tabulate their data in the appropriate census.[14]

NC-X6, Administrative Offices or Auxiliary Establishments—Many multiunit companies maintain separate establishments to provide centralized administrative management, or other supporting services for other establishments of the same company, but not for the general public or other companies. They were asked to complete form NC-X6 for those establishments. The form contained questions on the approximate number of employees engaged in such functions as centralized administration, research and development, warehousing, and other auxiliary activities, and on the cost of research and development work performed by these nonmanufacturing establishments. The respondent was also asked to describe the industry activity of the operating establishments serviced by the centralized office or auxiliary unit reporting on form NC-X6.

NC-K1, Company Summary Report—Each multiunit company with 250 employees or more received a form NC-K1, Company Summary Report, in addition to a specific questionnaire for each establishment. The NC-K1 requested consolidated company totals for receipts, new capital expenditures, inventories, and fixed assets, which are published as part of the Bureau of the Census' Enterprise Statistics Program described in section I.

Census of manufactures forms—The questionnaire reproduced in the appendix, form MC-36B, is typical of the approximately 200 forms used for operating manufacturing establishments. Each of these forms was designed to be used for a specific group of industries. Since it is desirable to retain comparability in the annual survey of manufactures for establishments reporting in the sample, form MA-100 was substituted as the front sheet of the census form (e.g., MC-36B) to collect the information common to all industries. Whether or not form MA-100 was used, the inquiries on the 200 forms were identical except for the detailed questions on products shipped, materials used, and miscellaneous topics such as operations performed, equipment used, and delivery of products.

Short forms—Some industries include a large number of small- to medium-sized firms that account for a significant portion of the industry's output. Usually, these firms are not so small that the limited data in the administrative record files would meet the needs of the census. To obtain sufficient data, yet hold the reporting burden down for these smaller firms, special abbreviated short forms were designed. They obtain the key input and output statistics without the detail requested on the standard forms. A sample form is included in appendix D.

Annual survey of manufactures forms—Form MA-100 is the establishment report used in the ASM since 1949 (with modifications). The establishment's 1976 data were imprinted on the report form before mailing, thus aiding the respondent in following the instructions for the census. Item 11-A, "value of products shipped and other receipts," on form MA-100, corresponds to item 18 on the census forms such as MC-36B.

In years between censuses, the ASM collects data for broad classes of products; whereas, every 5 years, in the census, item 18 calls for information or individual product shipments.

Other related forms—Form CB-50F, Census of Distributive Trades Electrical Goods, which is reproduced in appendix D, is typical of the several forms used for wholesale establishments in the census of business. Some manufacturers operate their own wholesale establishments which the Bureau of the Census classifies as "manufacturers' sales branches and sales offices." The wholesale forms differed only in the kinds of products sold as listed in item 10. Item 18 provides the information needed to classify the establishment as a sales branch or sales office.

MC-171, Department of Defense Establishments, and MC-D4, Penal Institutions—These forms were used to collect information on government-owned and government-operated manufacturing establishments. They were used for two types of establishments:

[14] The use of form NC-X3 is also discussed in item B, Mailing Lists.

a. Manufacturing facilities owned and operated by the Department of Defense.
b. Prison industries (Federal, District of Columbia, and State).

The data were prepared with the cooperation of the Department of Defense, the Department of Justice, and the District of Columbia and State prison systems. For Department of Defense installations, information was provided on employment, worker-hours, payrolls, cost, and value of work done, by industry group and by State. For prison industries, however, only product data were requested. The data are presented in a special report included in volume I and are not included in the totals for operating manufacturing establishments.

8. MAILING LISTS

General—As discussed in item 6, the list of respondents for 1977 was obtained from IRS-SSA records. Since the IRS-SSA lists consist essentially of the names and addresses of companies rather than establishments,[15] it was necessary to follow separate procedures for multiunit companies (those operating at more than one location).

The precanvass—Multiunit companies were required to file at least one establishment report[16] covering each location. In order to mail the appropriate questionnaires, it was necessary to determine the type of activity at each location operated by multiestablishment companies. The Bureau of the Census has conducted an annual update of its directory of establishments operated by large companies in which Report of Company Organization (form NC-X1)[17] is mailed each year to multiunit companies.

All of these forms consist of a report on company affiliation and a list of the domestic establishments operated by the company. The company's establishments as identified in census records are prelisted and the respondents are asked to correct this list. They are also asked to describe new establishments not prelisted and indicate their approximate size.

Large multiunit companies are segregated for special handling because of possible overlaps and duplication. Many of these companies are active in retail and wholesale trade as well as in manufacturing. The reporting instructions are reviewed in discussions with officials of the accounting departments of many of these firms to make certain that the procedure is understood and the establishments are properly described on form NC-X1.

Single-unit companies—The mailing lists for single-unit companies (those operating at only one location) were developed from an initial control file assembled from IRS and SSA records. Out-of-scope companies (those whose activities were not to be surveyed in the economic censuses) and those identified as multiunits in the multiunit directory were removed. A special survey of out-of-scope companies with more than 50 employees was conducted, in some industries, to make certain they should not be included in the census. Some names were added to the mailing list as a result. Single units with over 150 employees were mailed form NC-X1 to determine if they were multiunits.

The final step was to identify the small companies which were not to be mailed because census-type statistics were to be developed from administrative records. The remaining records constituted the mailing lists for single-unit companies.

General schedule—While these lists generally contained adequate industry information to determine the proper form for mailing, a number of the records did not have precise industry information associated with them. Form NC-X3, General Schedule, which is reproduced in appendix D was mailed to these companies. Since it was assumed that these companies were quite small, only a few key figures were requested. The completed reports were coded and included in the tabulations. If form NC-X3 indicated that the company was actually large, it was later requested to file one or more of the appropriate standard questionnaires.

9. COVERAGE AND ACCURACY

Since the list of companies obtained from IRS and SSA records was considered to be complete, no field coverage check was conducted. The precanvass and other special procedures for multiunit companies described in item 8, Mailing Lists, and item 11, Data Collection, were designed to secure complete lists of establishments; thereby simplifying the IRS-SSA company list. Control totals, in terms of employment and payrolls of multiunit companies, were also used to verify the completeness of establishment coverage.

It was possible to compare statistics tabulated from the census of manufactures with the Bureau of the Census' Current Industrial Reports Series, or with data originating with other agencies and, thus provide a further confirmation of completeness and accuracy. These figures range from employment and wage totals compiled by the Bureau of Labor Statistics to detailed commodity output figures published by the IRS, the Fish and Wildlife Service, and the Department of Agriculture. In the industry reports in volume II, differences between the census of manufactures and other statistics are explained wherever possible. Census of manufactures comparability with broad measures such as national income, new capital expenditures, and production indexes are discussed elsewhere in this introduction. The Bureau of the Census' other procedures designed to improve the accuracy of the census data are discussed above in the items on data collection and processing.

[15] The SSA records for multiunit companies identify "reporting units," which in many instances correspond to census establishments. The differences are such, however, that it was found necessary to obtain up-to-date lists of establishments as described in this section. Also, the Bureau of the Census concept of a company differs from the IRS-SSA definition, since the census company includes all establishments under common ownership or control. In the IRS-SSA records, subsidiary corporations are often treated as independent companies.

[16] If two or more distinct lines of activity were carried on at one location, separate reports were obtained under some circumstances. (For a complete discussion, see "Establishment Basis of Reporting" in section 4.)

[17] This form is reproduced in appendix D.

A discussion of the valuation of intracompany shipments by multiunit companies is included in item 15.

10. GEOGRAPHIC CODING

Accurate and complete information on the physical location of each establishment is required in order to tabulate the census data by standard metropolitan statistical areas, counties, and cities. As in previous censuses, the post office address and ZIP code of the establishment were not always accepted as defining the physical location, but respondents were required to describe the actual location in terms of street address; city, town, or village; county; and State. For establishments located in rural territory, the name or number of the nearest highway was requested and the distance from the nearest town or other urban place.

In censuses prior to 1963, clerks assigned geographic code numbers to each establishment based on the description furnished by the respondent. This process was slow and required careful verification. Beginning with 1963, a computerized system was developed which assigned an area code number and a prefix symbol to the mailing address before the questionnaires were mailed. The prefix symbol indicated whether or not the mailing address was clearly acceptable as describing the physical location. If there was any question about its acceptability, the respondent's description was later carefully reviewed after the questionnaire was received. The assignment of tentative code numbers by the computer was based on extensive reference files containing nearly a million business names and addresses.

11. DATA COLLECTION

Although the greater use of administrative records in 1977 substantially reduced the number of companies canvassed directly, there remained nearly 2 million which were required to file, including about 205,000 manufacturers. Small manufacturers, for whom the administrative records sufficed, numbered about 145,000. The assembly of several hundred different questionnaires into mailing packages correctly labeled and coded, combined with the correct instruction booklets, was an extensive operation.

Most of the 1977 questionnaires were mailed by mid-January 1978 with a due date of February 15. The collection phase was completed by late July 1978.

Companies which did not return their questionnaires by the due date had to be reminded that their returns were overdue. In all, there were five routine followups. Telephone calls were made to the large companies to help with reporting problems and to request that the forms be completed and returned.

Estimates based on data from administrative records were included in the census tabulations for the relatively small number which had not responded by the closeout date in July 1978. Thus, reported or estimated data for all companies and establishments in the original mailing list (except those determined to be inactive during 1977) were included in the final statistical results. A special effort was made to obtain actual returns from all large firms, so that the dollar volume of business represented by proxy returns was relatively very small.

12. DATA PROCESSING

General—The editing,[18] coding, and tabulation of data for the 5 million establishments represented in the 1977 economic censuses was a complicated task. Automatic data processing and other advanced techniques were used in all phases.

The questionnaires were mailed from and returned to the Bureau of the Census office at Jeffersonville, Ind., where most noncomputer (that is, clerical) processing operations were performed. The returns were screened to identify major problems that could be resolved by routine correspondence with respondents. Acceptable data were placed on a key-to-disc system, and the encoded data sent to Washington, D.C. on a high-speed transmission system. The Washington, D.C. staff handled computer operations and all operations in connection with the use of IRS and SSA records.

Preliminary screening—After they were checked in and assigned geographic codes, the questionnaires were reviewed clerically to see that they conformed to certain minimum requirements before further processing. For multiunit companies, the sum of employment and payrolls reported on its establishment questionnaires was compared with the control totals received on IRS form 941. Questionnaires received on single-unit forms were reviewed to ascertain whether they had become multiunits through merger or acquisition. Questions arising in the screening operation were resolved by writing or telephoning the respondents. Complex problems were referred to the Washington, D.C. professional staff.

Computer editing—As in the 1972 Census of Manufactures, most of the review for consistency among data items and completeness was done on the computer. Average values and tolerance limits for key operating ratios (for example, cost of materials per dollar of shipments, payroll per employee, production-worker wages per hour, etc.) played a fundamental role in the editing process. More than half of all 4-digit SIC industries had one or more data cells changed by more than 5 percent as a result of the application of these programs.

A detailed description of the step-by-step processing procedures appears in the Bureau of the Census publication, History of the 1977 Economic Census. This volume describes the procedures followed in both the centralized overall processing and in the individual censuses such as manufactures.

[18] In data processing, the term "editing" means the review of information collected on questionnaires or from other sources, with the objective of locating and correcting erroneous entries.

III. Comments on Statistical Measures and Tables

(Explanations and definitions of the various measures of activity for which statistics are compiled in the census of manufactures are presented in appendix A. In the following text, the limitations and other characteristics of some of these measures are discussed, the content of the statistical tables is described, and comparisons with other statistical series are presented.)

13. EMPLOYMENT AND PAYROLLS IN ADMINISTRATIVE OFFICES AND AUXILIARIES

In the industry statistics chapters, the data on employment and payrolls are limited to operating manufacturing establishments. In the summary tables and the area reports, the employment and payrolls of administrative offices and auxiliaries are included as well. The report filed for administrative offices and auxiliaries requested a description of the activity of the establishments that they serviced. However, the administrative offices and auxiliaries were coded only to the 2-digit industry group of the establishments they served, whereas the operating establishments were coded to a 4-digit manufacturing industry. In most of the tables with industry detail, the administrative offices and auxiliaries are shown as a separate industry group, but statistics for them by 2-digit industry appear in each volume in the general summary tables. As indicated in table H, the relative importance of administrative offices and auxiliaries has increased substantially in recent years because of a tendency to centralize functions formerly performed in manufacturing plants. Such functions include accounting (particularly where computerized), warehousing repair services, and miscellaneous others.

Table H. **Employment in Administrative Offices and Auxiliaries and in Operating Manufacturing Plants: 1977 and Earlier**

Census year	Employees in operating manufacturing establishments		Employees in administrative offices and auxiliaries		
	Thousands of employees	Percent change from previous census year	Thousands of employees	Percent change from previous census year	Percent of total employment[1]
1977	18,516	+2.7	1,074	+8.0	5.5
1972	18,032	-2.5	994	+19.8	5.2
1967	18,492	+14.0	830	+14.3	4.3
1963	16,235	+5.3	726	+20.6	4.3
1958	15,423	-1.4	602	[1]+32.9	3.8
1954	15,645	(NA)	453	(NA)	2.8

(NA) Not available.

[1]The apparent increase from 1954 to 1958 is believed to be somewhat overstated, because coverage of administrative offices and auxiliaries was more complete in the 1958 census.

Source: Census of Manufactures.

14. MATERIALS CONSUMED

Every establishment was requested to report the total cost of materials. In addition, quantity and cost information was collected for approximately a thousand specific materials. About 350 of these were "complete coverage" materials; i.e., every industry that consumed appreciable quantities of the material was canvassed so that the data would aggregate to at least 90 percent of manufacturing consumption. For the remaining materials, information on consumption was obtained only in those industries in which the materials were important inputs. Detailed consumption information was collected in item 17, the standard material inquiry; in item 18, the product inquiry (for items that were produced and consumed in the same plant); and in a few instances in a special inquiry. The resulting statistics are presented mainly in tables 6a and 7a of the industry statistics chapters.

Because American industry uses an enormous variety of materials, the choice of materials for which "complete coverage" consumption data (90 percent or higher) were obtained had to be strictly limited. The selection of a particular material for such coverage was based on the following criteria:

a. The importance as measured by the total value of U.S. consumption of the material.
b. The percentage of total consumption accounted for by manufacturing establishments.
c. The availability of consumption information from manufacturers' records.
d. Other factors such as the strategic importance of the material or the availability of historical data on the use of the material.

The "limited-coverage" materials were chosen, not only because they constituted important inputs for particular industries, but frequently because they provided information necessary to classify plants by SIC industry. In using the detailed data on materials consumed which appear in table 7 in the industry statistics chapters, of the following limitations should be noted:

a. Materials were reported for the establishment as a whole and no attempt was made to ascertain how much of the material was used in each of various products. Thus, the industry totals appearing in table 7 include consumption in secondary products as well as primary products

of the industry. The extent of secondary production in each industry is measured by its specialization coverage ratio shown in table 5b of the industry chapters.

b. Special attention should be paid to the codes ending in "000" and captioned "materials, parts, containers, and supplies, n.s.k." The amounts appearing on these lines are totals imputed for (1) establishments whose statistics were developed from administrative records, and (2) totals for establishments which returned report forms but failed to report their consumption in specific terms. Thus, for most industries, the data for a specific material are understated. A judgment on the statistical significance of the understatement may be made from the ratio of the value shown for the "n.s.k." (code 000) to the total of materials, components, parts, containers, and supplies for the industry.

c. Establishments consuming less than a specified amount of material were not requested to report consumption of the material separately. For the majority of individual materials, the minimum amount was $10,000. The use of this cutoff is not believed to have had a significant effect on the totals, although in 1972 a lower cutoff of $5,000 was used.

d. A total of "n.e.c." material code 970099 was collected on most forms and is published for each industry. This is the total cost of materials for an industry for which no material items were prelisted on the form. A sample survey, MA-131, 1977 Supplemental Survey of Materials Consumed, was conducted to provide material consumption estimates for the cost of materials reported in material code 970099 for selected industries. Results of this survey are shown in the subject report Selected Materials Consumed.

15. VALUE OF SHIPMENTS

Value of shipments of multiunit companies—Except for a few industries, the respondents were instructed to report net selling values, f.o.b. plant, after discounts and allowances and excluding freight charges and excise taxes. Multiunit companies were instructed to report for each establishment as if it were a separate economic unit and, in particular, to report interplant transfers at their full economic value. Full economic value is defined as not only the cost of production but also a reasonable proportion of company overhead and profits. Generally, there is no advertising or other selling cost assigned by companies to interplant transfers, so it would be expected that the value per unit of such transfers would be less than that for commercial sales. To assure consistency in the valuation as the interplant transfer moved though the company, the plant receiving the transferred goods was instructed to include them in its cost of materials at the same value as at the shipping point, plus the cost of freight and other handling charges.

If the goods were transferred to sales branches, or sold through separate sales offices, the "f.o.b. plant" instruction implies that the value is somewhat lower than the final invoice value, because the cost of selling (mainly the cost of operating the sales branch or office) is excluded.

However, there is reason to believe that these instructions were not followed uniformly by all companies. In a record-keeping practice study of 54 multiunit companies conducted a few years ago, it was found that about half of them had reported interplant transfers of semifinished products at commercial or market prices, which tend to be somewhat higher than the "cost plus overhead and profit" requested in the census instructions. Where finished products were transferred to separate selling organizations, half of the companies interviewed valued the products leaving the manufacturing plant at their final or invoice price, or somewhat higher than the requested "f.o.b. plant" transfer value. It appears from this study and other observations that the value of shipments of products reported by multiunit companies tends to be overstated. If it was known that a substantial amount of a product tended to be transferred to establishments of the same company, separate quantity and value figures were requested on the amount transferred and the amount sold outside the company. Data on these shipments, the unit value of which tends to be different from the unit value for shipments outside the company, are presented separately in table 6a in the industry chapters of volume II.

Individual products—In the 1977 census program, information was collected on the output of approximately 13,000 individual product items.[19] A "product" as used in the census of manufactures is the finest level of detail for which output information was requested. It is not necessarily synonymous with the term "product" as used in the marketing sense. In some cases, it may be much more detailed and, in other cases, it is more aggregative. For example, there is a long list of pharmaceutical preparations but a single item for all canned meats. If detailed production figures were available from other government sources or reliable private surveys, it was not considered necessary to request extensive detail in the census.

Some 6,000 of the product items were listed separately on the 1977 census report forms. Data for the remaining 7,000 products were obtained monthly, quarterly, or annually in commodity surveys of the current industrial reports program of the Bureau of the Census. Totals for the year 1977 for these items compiled in the commodity surveys are shown in table 6a, "products shipped," in the industry chapters of volume II. On the 1977 census forms, only an overall control total or "tieline" was obtained. In table 6a, both the tieline total and the total of the detail obtained in the current industrial reports are shown to indicate how closely the two surveys were reconciled.

Typically, both quantity and value of shipments were collected. However, physical quantity measures are not meaningful for some product lines, and for these, only value of shipments was collected. If a product was used to a large degree in the fabrication of other products within the same establishment in which it was produced, total quantities produced and often the quantities consumed were collected. Information on production, as well as shipments, was also collected for products for which there are significant differences between the two

[19] See 1977 Census of Manufactures MC77-R-1, Numerical List of Manufactured Products.

because of wide fluctuations in finished goods inventories. Alternate measures of output of products, such as value of work done for products with long production cycles, were used as appropriate and feasible.

Classes of products—The individual products were aggregated into classes of products which were, in turn, grouped into the primary products of each industry. In the code structure, a 7-digit number is assigned to the individual product, a 5-digit code to the class of product, and a 4-digit code to the total primary products in an industry. (See section 4 for application of coding structure to the assignment of SIC codes for establishments).

The 13,000 product items in the 1977 census (including products from the current industrial reports program) were grouped into approximately 1,500 separate product classes. General similarity was the basis for the product class combinations within each 4-digit industry, i.e., kind or use of products, the manufacturing processes, type of markets, or materials used. The economic significance of the class was also taken into account; residual products of an industry were grouped when the dollar value of the products did not warrant separate classes.

Since preserving confidentiality of the data of respondent companies is a determinant of the amount of detail that can be published, the larger number of respondents included in the product-class shipments totals permits many more cross tabulations than do the 7-digit products. In the industry chapters of volume II, product classes by State appear in table 6b and by industry of the establishment producing them in table 5c. The latter table clearly shows the primary and secondary product mix of an industry, as well as the interrelationship between the 4-digit industry value of shipments and the 4-digit product group value of shipments.

It is possible to classify individual establishments not only by 4-digit industry, but also by the largest class of products they produce within that industry. Table 5a provides finer industry-type general statistics for establishments classified according to the degree to which they specialize in producing a specific class of products.

The class-of-product concept was incorporated by the Bureau of the Census into the 1947 Census of Manufactures after it developed the technique in the compilation of World War II production statistics. Product classes were used to collect product information in the first ASM conducted in 1949. The product classes tend to be redefined more frequently than the SIC on which they are based in order to keep abreast of the growth and decline of products.

Effect of use of administrative records on product data—As noted elsewhere in this Introduction, 140,000 small manufacturers were not mailed report forms and most of their detail was imputed based on limited information in IRS and SSA administrative records. All of the value of products of these small establishments were coded only to the 4-digit products of the industry in which they were classified. These product shipment are uniquely identified in table 6a. Also uniquely identified are product shipments of reporting companies which were described too generally to code below the 4-digit level. Frequently, these were residuals in the company's records which the company felt it could not further break down. Table I, summarized by 2-digit group, reflects the importance of these "n.s.k." product shipments. Except in a few industries, they tend to be moderate in size—except in lumber, furniture, and printing (SIC 24, 25, and 27). The "n.s.k." of the respondents tends to be larger than that of the administrative records.

One factor tends to reduce the value of products, n.s.k., attributed to administrative record companies that affects table I, particularly. In some 4-digit industries, there is only one product category (an example is Industry 3273, Ready-Mixed Concrete). Administrative-record estimates for these products were treated as specific information and not tabulated as "n.s.k." headings.

In using the data for the specific 7-digit products shown in table 6a, the importance of the "n.s.k." has to be considered. The shipments of individual products tend to be understated somewhat in proportion to the size of the "n.s.k." Census-to-census comparison of 7-digit products should be made with caution if there has been a significant increase or decrease in the importance of the n.s.k.

16. DUPLICATION IN COST OF MATERIALS AND VALUE OF SHIPMENTS

The aggregates of the cost of materials and value of shipments figures for industry groups, and for all manufacturing industries, include large amounts of duplication since the products of some industries are used as materials by others. With some important exceptions, such as SIC 3312, Blast Furnaces and Steel Mills, this duplication is not significant within individual 4-digit industries. However, it is significant at the 2- and 3-digit industry levels because these group totals often include industries which are successive stages in the production of a finished manufactured product. Examples are the addition of flour mills to bakeries in the total value of shipments of SIC major group 20 and the addition of pulpmills to papermills in group 26. Economists have estimated that the value of manufactured products exclusive of such duplication—the value of finished manufactures—tends to approximate two-thirds of the total value of shipments reported in the census of manufactures.

Because the amount of duplication of the cost of materials in the value of products figures cannot be measured with any degree of precision, caution is urged with the use of the value of shipments totals at the 2- and 3-digit industry group levels.

Even where there is no significant amount of duplication within an industry group, value of shipments figures are not the best measures of the relative economic importance of individual manufacturing industries or geographic areas. There are wide variations in the ratio of materials, labor, and other processing costs to value of shipments; both among industries and within the same industry. The manufacturing process contributes only a small amount to the sales value of some products; but a large amount to the final value of others. Value added by manufacture is a better measure of the net contribution of an industry to the Nation's overall output.

Table I. **Value of Products, Not Specified by Kind: 1977 and 1972**

Product group code	Total value of product shipments (mil. dol.)		Products not specified by kind											
			Total (mil. dol.)		Large companies (mil. dol.)		Small companies (mil. dol.)		Percent attributed to--					
									Total		Large companies		Small companies	
	1977	1972	1977	1972	1977	1972	1977	1972	1977	1972	1977	1972	1977	1972

37	161,607.6	91,522.0	1,999.9	1,413.5	1,084.9	1,126.8	915.0	286.7	1.2	1.5	.7	1.2	.6	.3
38	26,949.1	14,484.8	1,277.4	556.1	662.6	413.8	614.8	142.3	4.7	3.9	2.5	2.9	2.3	1.0
39	17,254.1	11,270.0	2,373.3	1,521.7	1,600.1	903.2	773.2	618.5	13.8	13.5	9.3	8.0	4.5	5.5

Note: These values are product shipments, irrespective of the industry in which the products were made and exclusive of miscellaneous receipts, and, therefore, differ from the industry group totals shown in the general summary tables. However, products primary to more than one product group are classified based on the industry in which they were made. Data for some product groups may differ slightly from the data collected in order to avoid disclosing operations of individual companies which have previously been withheld from the tables 6a of the 1977 and 1972 Censuses of Manufactures Industry Series.

17. VALUE ADDED BY MANUFACTURE

General—The first step in the calculation of value added is the conversion of the value of shipments (including resales and miscellaneous receipts) to value of production by adding the ending inventory of finished foods and work in process inventories and subtracting the beginning inventory. The cost of materials (including materials, supplies, fuel, electric energy, cost of resales, and cost of contract work) is then subtracted from this value of production to obtain value added.[20]

Value added avoids the duplication in the value of shipments figure which results from the inclusion of the shipments of establishments producing materials and components, along with the shipments of establishments producing finished products. It does not exclude the cost of services purchased from other business firms, as does the concept of value added, used in the national income accounts.[21] Nevertheless, it is considered to be the best value measure available in census data for comparing the relative economic importance of manufacturing among industries and geographic areas.

Gross national product, national income, and value added—The national income accounts provide two measures of national output or value added originating in manufacturing: (1) gross national product (GNP), or, more precisely, gross domestic product (GDP),[22] and (2) national income without capital consumption adjustment. These two measures are statistically different and neither is completely comparable to census value added.

GDP originating in manufacturing is the net value of the output of goods and services produced in the U.S. at market prices before deductions for depreciation charges and capital consumption allowances. It differs, in part, from the census value added since it includes indirect business taxes (e.g., sales, excise, and property). Excise and sales taxes are excluded from the f.o.b. census value of shipments and, thus, from census value added. Property taxes are part of the cost of doing business included in census value added, since only the cost of materials is deducted from f.o.b. shipments. A greater difference between GDP and census value added rests in the exclusion of purchased business services from GDP, but not from census value added. Both GDP and census value added include the basic factor costs of production—labor costs, property costs including depreciation, and profits. Depreciation in the two series is calculated differently, however. The census collects depreciation as carried on the books of the establishment. Thus, it tends to be the depreciation

[20] For a few industries (for example, ship building) where value of work done is substituted for value of shipments, no adjustment is made for change in inventories. In a few other industries where value of production is collected, the inventory adjustment is made only on the basis of change in work-in-process inventories.

[21] Collection of data on the cost of purchased business services at the plant level presents many problems. Advertising by multiunit companies, for example, is frequently charged at the company level and the cost either not allocated to plants or, if allocated, are only included as part of a broader company overhead category. National income data, on the other hand, are compiled, in part, from company rather than plant data, such as the IRS Statistics of Income in which advertising is presented as a separate cost item based on company reports.

[22] Gross national product is the market value of goods and services producted by labor and property supplied by *Residents* of the United States. Gross domestic product is the goods and services attributable to labor and property *located within* the United States.

charged against the original purchase price of the plant or equipment on a tax return basis. In calculating GDP, these tax return allowances are adjusted to account for the economic service lives, straight-line depreciation, and replacement cost.

In compiling the national accounts, it is necessary to rely on two different sources of data: (1) establishment-based data similar to the census for labor income, and (2) company-based data for profit and other company level income and cost charges. In estimating the GDP for manufacturing, the property-type incomes, interest, depreciation, and profit have been reestimated to an establishment basis by the Bureau of Economic Analysis (BEA). Thus, conceptually, both the GDP and value added tend to be on a comparable establishment-industry basis.

In the national accounts, 2-digit detailed statistics within manufacturing are compiled only on a national income basis, without the capital consumption adjustment. National income differs from GDP by the exclusion of indirect business taxes and capital consumption allowances, but before the capital consumption adjustment. Unlike GDP, it remains a mixture of establishment-based data and company-based data for profits and company-type costs. This results in the inclusion in national income of the net value added created by nonmanufacturing establishments of companies primarily engaged in manufacturing, but the exclusion of value added created by manufacturing plants of primarily nonmanufacturing companies. It is thought that this tends to raise the national income attributed to manufacturing. This effect can be seen in the petroleum and coal products industry group where nonmanufacturing activities are so significant that national income exceeds value added (see tables J and K).

Table K provides a year by year comparison of GDP and national income to value added. GDP tends to be 10 to 20 percent lower. In recent years, there are some erratic variations in these relationships. In part, this is thought to be the result of the different treatment of the change in inventory that is used in the two series. The census inventory figures are book value inventories and, thus, a mixture of last-in-first-out (LIFO) and first-in-first-out (FIFO) and other historic accounting methods. In the national income accounts, these inventories are converted to current prices comparable to the prices used to value the GDP, and, thus, the change in inventories is on a current-priced value consistent with sales. Significant differences occur in the change in book value and currently-priced inventories in years of rapidly changing prices. The magnitude of these differences can be partially judged by the size of the inventory valuation adjustment used by BEA (see table L).

Reconciliation of GDP and value added—In recent years, the census and the annual survey of manufactures have been obtaining data on some of the residual costs included in census value added. As a result, it is possible to reconcile in more detail the differences between GDP and value added in manufacturing. In table M, the census value added, at $585.2 billion, exceeded GDP at $462.4 billion. When indirect business taxes (other than property taxes) are deducted from GDP, it drops to $444.0 billion, or $141.2 billion less than census value added. The labor components of the two series are reasonably close, although not identical. Census depreciation, on a book value basis, however,

[1]Source: Revised estimates of gross domestic product by major industries, Survey of Current Business, July 1978, p. 28; National Income and Product Accounts.

[2]In comparing gross domestic product and national income originating in manufacturing with value added, the role of change in inventories must be recognized. Census value added is value of shipments less the cost of materials adjusted for the change in book value inventories (finished goods and work in process in most industries.) Gross domestic product and national income originating in manufacture include the change in business inventories as part of gross private domestic investment. In the National Income Accounts, the book value change in inventories is adjusted for change in prices to convert it to prices similar to those used to measure the value of output. This adjustment is referred to as the inventory valuation adjustment. In periods of significant inflation, such as 1974, this adjustment can be substantial and create a slower year-to-year growth in gross domestic product originating than in value added in manufacturing, so there is a drop in gross domestic product and national income originating as a percent of value added in manufacturing. In periods of stable prices, the movements of the two inventory series usually are similar.

[3]Value added for 1947 and earlier years is unadjusted.

Table L. **Change in Manufacturing Inventories: 1977**

(Billion dollars)

Item	Value
Change in book value inventories (census)	$13.4
Inventory valuation adjustment	-8.4
Change in inventories (gross national product)	5.0

Note: In calculating gross national product, the Bureau of Economic Analysis uses the change in total inventories. In compiling value added, the Bureau of the Census typically uses finished goods and work in process inventories only. In 1977, these inventories were $9.3 billion compared with total inventories of $13.4 billion.

Source: U.S. Department of Commerce, Bureau of Economic Analysis.

is less than the GDP capital consumption allowance, adjusted for economic service lives, straight-line depreciation, and replacement cost. Census book-value depreciation was $26.7 billion, the adjusted GNP capital consumption allowance, $40.0 billion. After measurable labor costs and depreciation were deducted, unexplained census value was $231.4 billion compared with an explained GNP of $81.4 billion. Census has not been able to measure all the remaining components of value added, especially those parts which are company-type charges and profits. In 1977, information was collected on rentals and cost of communication services, and maintenance and repair purchased from other companies, a total of $22.4 billion, leaving the unexplained portion of value added at $209.0 billion. If the GDP estimates of $9.9 billion for property taxes and $71.4 billion for profits and interest payments are applied to this, there is a final unexplained portion of value added amounting to $127.7 billion.

This residual is attributable to company overhead other than central office payroll, e.g., company-level depreciation, business taxes, and purchased services (advertising, legal, accounting, and other professional services, patents, royalties, etc., not readily measurable separately at the plants).

18. CAPITAL EXPENDITURES AND GROSS ASSETS

Capital expenditures—The manufacturers were instructed to report expenditures of the type chargeable to fixed assets

Table M. COMPARATIVE STATISTICS ON CENSUS VALUE ADDED AND GROSS DOMESTIC PRODUCT: 1977

(Billion dollars)

Item	Census value added	GDP
Total	—	462.4
Less: Indirect tax (except property) business and not subsidies[1]	—	18.4
Equals	[1] 585.2	444.0
Less: Compensation of employees total	327.1	322.6
Census payrolls of operating plants	242.0	—
Census payroll supplements of operating plants	49.9	—
Census payrolls of central offices and auxiliaries	[2] 22.0	—
Census payrolls of sales branches offices	[2] 13.2	—
Equals	258.1	121.4
Less. Additional cost measured by census of manufactures	49.1	40.0
a. Included in GDP: Capital consump. allowance[3]	26.7	40.0
b. Excluded from GDP	22.4	—
Purchased communication service	3.6	—
Purchased maintenance and repairs	11.9	—
Rental payments, building and equipment	6.9	—
Equals: Residual costs included in census value added	209.0	81.4
Less: Costs or incomes assumed to be equal to those measured in GDP	93.6	81.3
Property tax	9.9	9.9
Interest and profit type income	71.4	71.4
Difference between census book value depreciation and GDP depreciation[3]	12.3	—
Equals: Remaining costs in value added (company overhead, other than payrolls included above: e.g., company-level depreciations, business taxes, and services purchased by company or directly by plants (advertising, legal, accounting, and other professional services; communications, patent fees, royalties, travel costs, etc.)	115.4	(.1)

[1] Census measures value of shipments exclusive of sales and excise taxes. Property taxes are a cost included in value added.

[2] There is strong evidence that most companies include the payroll of administrative offices and auxiliaries and all sales offices in setting the f.o.b. value of shipments from their manufacturing plants. Those costs are, thus, included in value added. Many companies also indicate that they include the cost of sales branches, although this may not be universally true (see "value of shipments" in text).

accounts, for which depreciation reserves are normally maintained. Actual capital outlays during the year were requested, not the final value of equipment put in place or structures completed during the year.

The Bureau of the Census estimates of capital expenditures tend to be lower than those published by BEA in its quarterly survey of expenditures for plant and equipment. In addition to normal sampling variation, a major source of difference rests in the scope of the two series. Census data relate only to manufacturing establishments.

The BEA series relating to manufacturing includes all establishments of manufacturing companies, nonmanufacturing as well as manufacturing, but excludes manufacturing establishments of companies that they have classified as chiefly nonmanufacturing. This difference in the two series is particularly important in the petroleum industry where company expenditures for developing new wells and new distribution facilities are ordinarily much larger than their capital expenditures at refineries. The BEA and Census data for recent years are shown in tables N and O.

Table N. Expenditures for New Plant and Equipment—BEA Series and Census: 1977 and Earlier Years

(Billion dollars)

Year	BEA-series[1]	Census (census of manufactures and ASM)[2]	Column B divided by column A
	(A)	(B)	(C)
1977	69.2	47.5	.69
1976	59.9	40.5	.68
1975	54.9	37.3	.68
1974	53.2	35.7	.67
1973	42.4	27.0	.64
1972	35.4	24.1	.69
1971	33.6	20.9	.62
1970	37.0	22.2	.60
1969	36.3	22.3	.61
1968	32.3	20.6	.64
1967	32.3	21.5	.67
1966	31.4	20.2	.64
1965	25.4	16.6	.65
1964	21.2	13.3	.63

1961	15.5	9.8	.63
1960	16.4	10.0	.61
1959	13.8	9.3	.67
1958	13.0	9.6	.74
1954	12.0	8.2	.68
1947	8.7	[2] 6.0	.69

[1] Source, U.S. Department of Commerce, Survey of Current Business, October 1980.

[2] Excludes data for establishments under construction but not yet in operation.

[3] Capital consumption allowances in GDP and depreciation as collected in the census are not completely comparable. Depreciation reported in the census is that carried on the books of the establishment and is charged against the original purchase cost of the assets. In the GNP accounts, a "capital consumption adjustment" is made to place the depreciation more on a replacement cost basis. Specifically, it is "the tax-return-based capital consumption allowances, less capital consumption allowances, that are based on estimates of economic service lives, straight-line depreciation, and replacement cost."

Gross value of fixed assets—In addition to reporting capital expenditures during the year, the manufacturers were requested to report the original cost value of fixed assets (structures and machinery and equipment) in place at the end of the year, along with depreciation and retirements during the year. This series, however, is based on reports filed in the ASM sample. It is conceptually comparable with the capital expenditures data. As the census capital expenditures series differs from the BEA series, so the census gross assets series will differ from similar series based on company level reports, i.e., those appearing in the IRS Statistics of Income and the FTC Quarterly Financial Report of Corporations. Since the census assets series is also based on sample estimates from the ASM, it is subject to a sampling error. (See appendix A for more complete definitions of terms.)

19. INVENTORIES

The value of end-of-year inventories held by each manufacturing establishment was obtained for each year. Separate information was requested for—

a. Finished goods,
b. Work-in-process, and
c. Materials, supplies, fuel, and other inventories.

A measure of the changes in inventories from the beginning to the end of each year is essential to the conversion of value of shipments during the year to value of production, and, therefore, to the calculation of value added. The ratios of inventories to shipments at different times are also used in analysis of trends and business-cycle movements. For the best use of all of these measures, the inventories should be valued in the same prices as the shipments. Census inventory statistics have some limitations in these uses.

The inventories, as collected currently and in the past, have been the inventories as carried in the books of each respondent. In aggregating those inventories and calculating inventory changes, census procedures make no adjustments for the different methods of inventory valuation used by the respondents. Change in inventories and the relationship of inventories to shipments can vary significantly depending on whether last-in first-out (LIFO) or some historical method such as first-in first-out (FIFO) is used. These differences can become very significant in periods of rapid- and large-price changes. In recent years, the Bureau of the Census has been obtaining information on the preparation of inventories valued by the different accounting methods, both in its monthly surveys and the annual survey of manufactures. Some results have been published in the monthly Manufacturers' Shipments, Inventories, and Orders survey but none for the ASM. Considerable difficulty has been encountered in obtaining results of publication quality because of the complexity of the accounting at the establishment level and corporate level in large companies. Unofficial results have been made available to BEA to assist them in their adjustment of book value inventories to current and constant prices for use in the national income accounts. Some of the anomalies in the census value added and the national income originating in manufactures are due to the different treatment of inventory change in the two series.

In using inventory data by stage of fabrication for all industries at the industry level, it should be noted that an item treated as a finished product by an establishment in one industry may be reported as a raw material by another establishment in a different industry. For example, the finished-product inventories of a steel mill would be reported as raw materials by a stamping plant. Such differences are present in the inventory figures by stage of fabrication shown for individual industries, industry groups, and all manufacturing which are merely aggregates of figures reported by establishments in specified industries.

For a few industries in the food group, there are special problems in the handling of inventories by stage of fabrication. These are industries in which the products are aged. Included among such types of products are stemmed and dried tobacco, cheese, and whiskey. It is not clear whether such products should be treated as finished-goods inventories or as work in process while in storage. In all these industries, substantial finished goods inventroies have been reported. These data have been summarized in the inventory tables in a consistent manner for all of the years included in this report.

20. PLANT SPECIALIZATION

As discussed in item 4 above, the primary products of a plant are those which determine its industry classification; all other products are referred to as secondary products. The value of a plant's primary products in comparison to its total production is referred to as its degree of specialization. For each plant, two measures of specialization were computed:

a. A 4-digit primary product-specialization ratio, which is the sum of the values of all the plant's primary products divided by the sum of all its primary and secondary products.

b. A 5-digit primary product-class specialization ratio, which is the sum of the largest 5-digit product-class value divided by the sum of its primary and secondary products (the miscellaneous receipts of the establishment were not included in these calculations). For example, assume that an establishment reported the following:

Total value of shipments and other receipts	$1,000
Miscellaneous receipts (resales, etc.)	15
Total value of products shipped	985
32731, Concrete pipe products	100
32722, Precast concrete products	785
32730, Ready-mixed concrete	100

This plant would be coded into Industry 3272, Concrete Products, with a primary product specialization ratio of 90 percent ($885 ÷ 985); it would be subclassified into the 5-digit Class 32722, Precast Concrete, with a primary product class specialization ratio of 80 percent ($785 ÷ 985).

21. CONFIDENTIALITY

The Bureau of the Census is prohibited by law from publishing any statistics that disclose information reported by individual companies. In suppressing figures to avoid disclosing information of individual companies, individual States are given precedence over geographic regions and divisions. This is an innovation for 1977, since in prior censuses the larger geographic areas were given precedence. As a result of this change in philosophy, it has become more difficult to produce industry detail for the larger geographic areas and data for the these areas are no longer published. States are given precedence over standard metropolitan statistical areas; standard metropolitan statistical areas over counties; and counties over cities.

In tables showing industry detail, major industry group (2-digit) totals take precedence over industry group (3-digit) totals which, in turn, take precedence over individual (4-digit) industries. Similarly, in product tables, 4-digit product groupings take precedence over 5-digit product classes and the latter over individual 7-digit products.

Such order of precedence was used because:

a. It was considered preferable to show State data for an industry, even at the cost of withholding data for a region. In recent years, there seemed to be more need for and use of data for individual States than for the larger regions—especially since many regional development programs encompassed clusters of States different from the standard regions and divisions.
b. By giving preference to industry-group statistics over individual industries within each State, the extent to which individual States can be compared within the SIC industry classification framework is greatly increased.

22. MICROFICHE AND COMPUTER TAPES

Data in many tables in the census volumes are available on microfiche and on computer tape.

One major data series, the Location of Manufacturing Plants, will be available only on computer tape. This series presents the number of establishments by employment size class by 4-digit SIC industry codes for States, counties, and places of 2,500 inhabitants or more. These data are available for both State and county by industry and State and place by industry.

Microfiche reports and computer tapes are sold by Customer Services (Microfiche/Tapes), Data User Services Division, Bureau of the Census, Washington, D.C. 20233.

23. SPECIAL TABULATIONS

Special tabulations of data collected in the 1977 Census of Manufactures may be obtained on computer tape or in tabular form. The data will be in summary form and subject to the same rules prohibiting disclosure of confidential information (including name, address, kind of business, or other data for individual business establishments or companies) as are the regular publications.

Special tabulations are prepared on a cost basis. A request for a cost estimate as well as exact specifications on the type and format of the data to be provided, should be directed to the Chief, Industry Division, Bureau of the Census, Washington, D.C. 20233.

24. ABBREVIATIONS

The following abbreviations and symbols occur frequently in text, tables, and footnotes:

—	Zero
(X)	Not applicable
(NA)	Not available
(D)	Withheld to avoid disclosing operations of individual companies
n.e.c	Not elsewhere classified
n.s.k.	Not specified by kind
(S)	Suppressed
(Z)	Less than one half of unit of measure shown
lin.	Linear
equiv.	Equivalent
hp	Horsepower
kWh	Kilowatt-hours
SIC	Standard Industrial Classification
IRS	Internal Revenue Service
SSA	Social Security Administration
ASM	Annual Survey of Manufactures
CIR	Current Industrial Reports
BEA	Bureau of Economic Analysis
SEC	Securities and Exchange Commission
GNP	Gross National Product

Other abbreviations, such as lb, gal, yd, doz, and bbl, are used in the customary sense. Where the term "tons" only is used, it refers to short tons of 2,000 pounds; where the figures are expressed in tons of 2,240 pounds, the unit of measure is specified as "long tons" or "gross tons."

(NA) Not available.

[1]The figures for 1939 to 1977 include data for employees at manufacturing establishments who were engaged in distribution and in construction work. The extent to which data for such employees were included in the figures for earlier years is not known. In addition to the employment and payroll for operating manufacturing establishments, manufacturing companies reported separately for administrative offices or auxiliary units (e.g., research laboratories, storage warehouses, power plants, garages, repair shops, etc.) that service the manufacturing establishment(s) of a company. These data are included in the total employment, payroll, and establishment figures for the years 1949 to 1977.

[2]The method of compiling these figures varied, as follows: All employees: For 1955 to 1977, figures represent the average of the number of production workers for the payroll period ended nearest the 12th of March, May, August, and November, plus all other employees for the payroll period ended nearest the 12th of March; for 1949 to 1954, they represent an average of all employees for the payroll period ended nearest the 12th of March, May, August, and November; for 1947, an average of 12 monthly figures for all employees; and for 1939 and prior years, the average number of production workers based on 12 monthly figures, plus the number of nonproduction workers for one payroll period (usually in October). Production workers: For 1949 to 1977, figures are based on employment for the payroll period ended nearest the 12th of March, May, August, and November; and for 1947 and prior years, they represent the average of 12 monthly figures.

[3]For the period 1954 to 1977, value added by manufacture represents adjusted value added, and for earlier years, unadjusted value added. Unadjusted value added is obtained by substracting the cost of materials, supplies and containers, fuel, purchased electric energy, and contract work from the value of shipments for products manufactured plus receipts for services rendered. Adjusted value added also takes into account (a) value added by merchandising operations (that is, the difference between the sales value and cost of merchandise sold without further manufacture, processing, or assembly), plus (b) the net change in finished goods for work-in-process inventories between the beginning and end of the year. For 1849 to 1933, cost of contract work was not subtracted from value of shipments in calculating value added by manufacture.

[4]The figures for 1951 to 1977 include expenditures for plants under construction and not yet in operation. This information was not collected prior to 1951.

Footnotes are continued on next page.

[5]Source: Board of Governors, Federal Reserve System.

[6]These figures represent estimates derived from a representative sample of manufacturing establishments canvassed in the annual survey of manufactures. These estimates, therefore, may differ from the results that would have been obtained from a complete canvass of all manufacturing establishments. The standard errors associated with these estimates are published in the annual survey of manufactures volumes for this period.

[7]The 1958 and subsequent years figures include establishments classified in Industry 3273, Ready-Mixed Concrete, and establishments classified in Industry 3599, Machinery, Except Electrical, N.E.C., that were engaged exclusively or almost exclusively in machine shop repair work. The data for such establishments are excluded from the figures for the period 1939 to 1957, but are included for 1929 and earlier years. The 1954 to 1966 figures include data for establishments engaged in the processing and distribution of fluid milk, Industry 202, Dairy Products. These establishments were not included in the figures for earlier census years. In addition, beginning with 1954, the figures include data for Industry 2411, Logging Camps and Logging Contractors, which were not included within the scope of the 1947 census. There were also a number of changes in the definition of manufacturing industries during earlier census years that affect the comparability of the historical series. Among the more important of these were the following: Figures for 1935 and later years exclude data for railroad repair shops and manufactured gas, which were included in 1899 to 1933 figures; the minimum size of establishment included for 1947 to 1966 was one employee; for 1921 to 1939, manufacturing establishments reporting value of shipments of $5,000 or more were within scope; whereas, for 1919 and earlier years, the cutoff was $500. (These changes in procedure have not appreciably affected the comparability of the historical data except for the figures on number of establishments.)

[8]The figures for 1939, but not for earlier years, have been revised on the basis of retabulation of the returns to exclude data for establishments classified as manufacturing in 1939 and prior years but classified as nonmanufacturing beginning with 1947. Value added by manufacture for 1939, prior to revision and on a basis comparable with 1937 and previous year, was $24.7 billion.

[9]The 1939 figures for all employees were revised on the basis of estimates rather than by retabulation of the 1939 reports. The estimates were made in the following manner: For the number of employees, by multiplying the retabulated figure for number of production workers by the ratio of all employees to production workers computed from the unrevised 1939 statistics; for salaries and wages, by multiplying the retabulated wage figure by the ratio for salaries and wages also derived from the unrevised 1939 statistics.

[10]Not including data for salaried officers of corporations and their salaries and, therefore, not strictly comparable with figures for other years.

[11]These figures for 1899 and earlier years represent hand and neighborhood manufacturing operations.

Table 2. **Operating Ratios for All Manufacturing Establishments Including Administrative Offices and Auxiliaries: 1977 and Earlier Years**

Year	Payroll per employee (dollars)	Assets per employee (dollars)	Production workers as percent of total employment (percent)	Annual hours of production workers (number)	Average hourly earnings of production workers (dollars)	Cost of materials as percent of value of shipments (percent)	Cost of materials and payroll as percent of value of shipments (percent)	Assets as percent of shipments (percent)	Value added per employee (dollars)	Payroll as percent of value added (percent)	Value added per production worker hour (dollars)

(NA) Not available. (S) Withheld because estimate did not meet publication standards.

[1]In annual survey of manufactures (ASM) years, data are estimates based on a representative sample of establishments canvassed annually and may differ from results of a complete canvass of all establishments. ASM publication shows percentage standard errors. For data prior to 1963, see 1972 Census of Manufactures, vol. I, table 7, General Summary chapter.

[2]Including administrative offices and auxiliaries (see appendix B).

[3]Aggregate of cost of materials and value of shipments figures include extensive duplication, since products of some industries are used as materials by others (see appendix B).

General Summary—Industry Statistics

--	ADMINISTRATIVE AND AUXILIARY[10]	-	-	-	-	-	-	-	994.3	13 772.3	-	-	-

Note: 1977 and 1972 payroll and sales data for small establishments (generally single-unit companies with less than 10 employees) were obtained from administrative records of other government agencies instead of from a census report form. These data were then used in conjunction with industry averages to estimate the balance of the items shown in the table for these small establishments. This technique was also used for a small number of other establishments whose reports were not received at the time the data were tabulated.

- Represents zero. (D) Withheld to avoid disclosing operations of individual companies. (NA) Not available. (X) Not applicable.

[1]The total value of shipments for industry groups (2- and 3-digit) and a few individual industries (4-digit) includes extensive duplication arising from shipments between establishments in the same industry classification.

[2]Establishments in this industry reported value of production instead of value of shipments. Consequently, the formula for computing value added by manufacture was modified to exclude any change in finished product inventories between the beginning and end of the year.

[3]Value added data include government-owned, contractor-operated plants which were estimated based upon averages reported for commercial establishments in prior years. Cost of materials data exclude government-owned materials furnished to government-owned, contractor-operated plants and include fuel and electricity purchased by or for the establishments. Value of shipments data include a calculated value of shipments for government-owned, contractor-operated plants comprised of adjusted value added plus the cost of fuels and electric energy. New capital expenditures include expenditures for plants under construction but not in operation. Capital expenditures of government-owned, contractor-operated plants are excluded from the totals for the industry.

[4]Includes expenditures for plants in operation and for plants under construction but not yet in operation.

[5]Government-owned, privately-operated establishments did not enter into the calculation of "primary product specialization ratio" or "coverage ratio" as all other dollar receipts for these establishments were included in "miscellaneous receipts."

[6]Minumum percentage; exact percentage withheld to avoid disclosing operations of individual companies.

[7]The value of shipments and cost of materials for this industry include substantial duplication; therefore, the specialization ratios and coverage ratios were not calculated.

[8]Relationships are not meaningful because of the predominance of receipts for contract and commission work on materials owned by others. Such receipts are treated as primary products for this industry.

[9]Establishments in this industry were requested to report value of work done instead of value of shipments. Consequently, the formula for computing value added by manufacture was not adjusted for any inventory change between the beginning and end of the year.

[10]In 1977 and 1972, in addition to the employment and payroll reported for operating manufacturing establishments, manufacturing concerns reported separately for administrative offices or auxiliary units which serve the manufacturing establishments of a company (e.g., storage warehouses, power plants, research laboratories, garages, repair shops, etc.) rather than the general public. Separate reports were obtained if these units were at different general locations from the establishments served or if they serviced more than one manufacturing establishment. The figures shown for these units do not represent a separate industry but rather a balancing total for all manufacturing industries.

Table 2. Employment and Labor Cost by Major Industry Group and Industry: 1977 and 1972

(For meaning of abbreviations and symbols, see introductory text)

Code	Industry group and industry	1977					1972					Standard error of estimate[2] (percent) for column--	
		Employees[1] (1,000)	Labor costs[1] (million dollars)				Employees[1] (1,000)	Labor costs[1] (million dollars)					
			Total	Payroll	Social Security and other legally required payments	Employer payments for other programs		Total	Payroll	Social Security and other legally required payments	Employer payments for other programs

[1]Data exclude administrative and auxiliary operations. For explanation of terms, see appendix A.

[2]A description of the standard error is given in appendix B . The percentage standard errors shown are the approximate relative standard errors of the estimates of level. The figures shown in parenthesis have associated standard errors exceeding 15 percent.

Table 3a. Summary Statistics by Major Industry Group: 1977

(Major groups descriptions are: 20--food and kindred products; 21--tobacco manufactures; 22--textile mill products; 23--apparel and other textile products; 24--lumber and wood products; 25--furniture and fixtures; 26--paper and allied products; 27--printing and publishing; 28--chemicals and allied products; 29--petroleum and coal products; 30--rubber and miscellaneous plastics products; 31--leather and leather products; 32--stone, clay, and glass products; 33--primary metal industries; 34--fabricated metal products; 35--machinery, except electrical; 36--electric and electronic equipment; 37--transportation equipment; 38--instruments and related products; 39--miscellaneous manufacturing industries. For explanation of terms, see appendix A)

[1]Includes administrative offices and auxiliaries.
[2]Aggregate of cost of materials and value of shipments for industry groups and for all manufacturing industries includes extensive duplication, since products of some industries are used as materials by others.

Table 3b. Gross Book Value of Depreciable Assets, Capital Expenditures, Retirements, Depreciation Charges, and Rental Payments for Buildings and Machinery by Major Industry Group: 1977

Item description	Total (million dollars)	Buildings and other structures (million dollars)	Machinery and equipment (million dollars)	Standard error of estimate for total (percent)

Note: Expenditures data, shown in table 3a, are census universe figures and may differ from ASM sample estimates shown in this table. Table 3b figures represent best estimate of year-to-year change as measured by continuing ASM sample, but are subject to sampling errors. Hence, as estimates of level, they are not as reliable as universe figures. For a description of the standard error of estimate, see the section "Qualifications of data" in appendix B.

Table 3c. **Cost of Purchased Services by Major Industry Group: 1977**

Code	Industry group	Repair of buildings			Repair of machinery			Communication services		
		Cost (million dollars)	Response coverage ratio (percent)	Standard error of estimate (percent)	Cost (million dollars)	Response coverage ratio (percent)	Standard error of estimate (percent)	Cost (million dollars)	Response coverage ratio (percent)	Standard error of estimate (percent)

38	Instruments and related products	41.8	68	5	80.0	66	4	113.4	78	7
39	Miscellaneous manufacturing industries	21.0	65	5	(82.8)	65	22	(105.4)	67	46

Note: Figures are estimates collected on the continuing ASM sample and, as such, are subject to sampling errors. Figures in parenthesis have standard errors of 15 percent or more.

(A) Indicates standard errors of 100 percent or more. The estimates are of limited reliability and should be used with caution.
(NA) Not available.

Table 4. Selected Statistics for Major Industry Groups by Employment Size of Establishment: 1977

Note: Data for administrative offices and auxiliary operations are excluded from this table.

(D) Withheld to avoid disclosing operations of individual companies. Data for this item are included in figures in parentheses above.

[1]Payroll and sales data for small single-unit companies with up to 20 employees (cutoff varied by industry) were obtained from administrative records of other government agencies rather than from census report forms. These data were then used in conjunction with industry averages to estimate the balance of items shown for these small establishments. This technique was also used for a small number of other establishments whose reports were not received at time data were tabulated. The following symbols are shown where estimated data based on administrative records data account for 10 percent or more of figures shown: E1--10 to 19 percent; E2--20 to 29 percent; E3--30 to 39 percent; E4--40 to 49 percent; E5--50 to 59 percent; E5--50 to 59 percent; E6--60 to 69 percent; E7--70 to 79 percent; E8--80 to 89 percent; E9--90 to 99 percent; E0--100 percent.

[2]Data are also included in respective size classes shown.

Table 5. **Selected Statistics for Administrative Offices and Auxiliaries by Major Industry Group of Establishments Serviced: 1977**

1977 code	Major industry group and central administrative offices and auxiliaries	Establishments[1] (number)	Employees (1,000)	Total payroll[2] (million dollars)

	Other activities	50	.8	9.4

(Z) Less than 50 employees.

[1]Detailed establishment data exceed totals since some establishments participate in more than one activity.

[2]Total payroll data for each industry group are actual. Detail data are estimates based on reported employment and average annual salaries determined from data collected in the 1977 Enterprise Statistics series.

- Represents zero. *Indicates 10 to 19 percent estimated. (D) Withheld to avoid disclosing operations of individual companies. (NA) Not available. N.E.C. Not elsewhere classified. N.S.K. Not specified by kind. [r]Revised. (S) Withheld because estimate did not meet publication standards. (Z) Less than 50 thousand dollars or hours; under 50 employees. GOCO Government-owned contractor operated.

[1]Figures are estimates derived from a representative sample of manufacturing establishments canvassed in annual survey of manufactures and, therefore, may differ from results that would be obtained from a complete canvass of all manufacturing establishments. Standard errors associated with estimates are published in annual survey of manufactures volumes for this period. Figures in parentheses either have associated standard errors exceeding 15 percent or are not consistent with other census series and related data. Thus, at individual product class level, estimates may be of limited reliability; however, they may be combined with other product class totals into broader aggregates which are of acceptable reliability.

[2]For years 1972 to 1976, all data were collected and published under Industry 2016, Poultry Dressing Plants, product codes only. However, industry 2016 products are defined to include only products processed at slaughtering plants. Industry 2017, Poultry and Egg Processing, is defined to include same products but processed from purchased carcasses. For 1977, comparable product classes were created for collecting products primary to both industries 2016 and 2017.

[3]For years 1972 to 1976, all data were collected and published under Industry 2017, Poultry and Egg Processing, product codes only. However, industry 2017 products are defined to include only products processed from purchased carcasses. Industry 2016, Poultry Dressing Plants, is defined to include same products but processed at slaughtering plants. For 1977, comparable product classes were created for collecting products primary to both industries 2017 and 2016.

[4]The individual product codes included in this class of product for 1972 differ from the 1967 definition. Products shifting into or out of this class of product represent approximately 10 percent of the total 1967 shipment at the U.S. level.

[5]Figures relate to shipments rather than production.

[6]Data for Product Class 20370, Frozen Fruits and Vegetables, n.s.k., are included with Product Class 20380, Frozen Specialties, n.s.k. As a result, total for industry 2037 is understated by approximately 5 percent.

[7]For 1972 and later years, individual product codes included in this product class differed significantly from prior years. Products shifting into or out of this product class represented more than 15 percent of total shipments at U.S. level.

[8]For 1972, product class 20512 was new. In prior years, figures were included in product class 20511.

Footnotes continued on next page.

[9]Withheld because estimated figure is negative. This is consequence of using difference method of estimation (see Estimating Procedures in appendix B) and of improved establishment reporting that resulted in changing classification of shipments from n.s.k. code for 1972 Census to specified 5-digit product classes for this year. Four-digit total is best estimate, even though smaller than sum of 5-digit values.

[10]Data in value of shipments column represent value of production rather than value of shipments. Consequently, formula for computing value added by manufacture was modified to exclude any change in finished products inventories between beginning and end of year.

[11]Data for 1977 are not directly comparable to prior years data. See "Description of Industries" in text for explanation.

[12]Value of shipments for this 4-digit group contains extensive duplication. Such duplication arises where products of some establishments are used as materials by other establishments classified in the same industry.

[13]1977 data for product class 22219 not comparable with data for prior years due to exclusion of bed and camp blankets, motor robes, etc.

[14]Included with data for Industry 2211, Cotton Sheets and Pillowcases.

[15]For purposes of comparability with prior years' annual survey of manufactures data, value of shipments of cut and sew shops (major group 23) has been excluded. (See tables 5c and 6a, volume II, 1977 Census of Manufactures).

[16]Excludes shipments of $473.7 million from Industry 2281, Yarn Mills, Except Wool.

[17]Excludes shipments of $279.0 million from Industry 2281, Yarn Mills, Except Wool.

[18]Excludes shipments of $138.7 million from Industry 2281, Yarn Mills, Except Wool.

[19]Excludes shipments of $56.0 million from Industry 2281, Yarn Mills, Except Wool.

[20]For purposes of comparability with prior years' annual survey of manufactures data, the value of shipments of the knitting mills (SIC group 225) has been excluded. (See table 6a, volume II, 1977 Census of Manufactures.)

[21]Excludes shipments made in weaving mills.

[22]For 1973 through 1976, data for product class 24110 included with combined total for product classes 24111, 24112, 24113, and 24114.

[23]1977 data for product classes 24211, 24212, and 24218 are not completely comparable to prior years because of 1977 revision to product class structure for industry 2421. For 1977, railway crossties and mine ties were switched from 24211 to 24218 and woodsiding from 24211 and 24212 to 24218. 1972 data for 24211 and 24218 have been revised to reflect switch of railway crossties and mine ties which represented approximately 5 percent for 24211 and 18 percent for 24218 of original figures. 1972 data were not revised to reflect switch of woodsiding. For 1972, data for woodsiding are not known.

[24]Prior to 1967, data for wood chips, product class 24215, were included in product class 24290.

[25]For 1972, individual product codes included in product class differ from 1967 and 1963. Products shifting into or out of this product class represent approximately 7 percent of total 1967 shipments.

[26]For 1967 and prior years, product class 24350 included data for product class 24360.

[27]Data for prior years are not comparable to 1977 due to misclassification in reporting between interior plywood using exterior glue and exterior plywood. 1977 data reflect corrections for these categories. Revised data for years prior to 1977 not available.

[28]Individual product codes included in this product class for 1967 and 1963 differ from posterior years definition. Products shifting into or out of this product class represent approximately 11 percent of total 1967 shipments at U.S. levels.

[29]This product class for 1967 and 1963 differs from posterior years definition. Products shifting into or out of this product class represent approximately 4 percent of total 1967 shipments at U.S. levels.

[30]For 1977 and 1972, total for product classes 25913, 25914, and 25915 are not completely comparable because of 1977 revision to product class structure for industry 2891. For 1972, product classes 25913 and 25914 include unknown amounts of product code 25915 00 which should be included in product class 25915.

[31]In 1967, the detailed grades of paper and paperboard collected were changed. Therefore, many of the product classes do not have comparable data for 1963.

[32]1967 and 1963 data for product class 26490 are not completely comparable to later years because of 1972 SIC revisions to industry 2649.

[33]Individual product codes included in product class for years prior to 1972 differ from product codes for 1972. Products shifting into or out of product class represent approximately 14 percent of total 1972 receipts.

[34]Product class 27544 included with product class 27546.

[35]For 1976 and earlier, value of shipments for industries 2823 and 2824 excluded shipments of producer textured manmade fibers. Data for those years were included in industry 2282, product class 22824.

[36]1977 totals for product classes 28314, 28315, and 28316 are not completely comparable to prior years because of 1977 revision to product class structure for industry 2831. For 1977, product class 28316 was formed from parts of product classes 28314 and 28315. Amount of product class 28316 included in totals for 28314 and 28315 is not known for prior years.

[37]For 1967 and 1963, individual product codes included in this class differ significantly from posterior years. Products shifting into or out of this product class represent more than 15 percent of total value at 1972 U.S. levels.

[38]Prior to 1972, industry 2869 includes values for urea. Due to revisions to Standard Industrial Classification product classes, urea became product code 28732 15 in 1972.

[39]Product group revised in 1972. 1967 data revised to agree with change; 1963 not revised. For 1967, products shifting into or out of product class represent approximately 14 percent of total shipments at U.S. level.

[40]For 1967 and 1963, total shipments did not include values for Product Code 28995 83, Embalming Chemicals, which was part of product code 39943 98.

[41]For 1963, totals excluded values for sizes, product codes 28995 63 and 28995 65.

[42]New SIC basis.

[43]Includes laminated glass made by primary producers (3211) as well as laminated glass made from purchased glass (3231). Separate totals are withheld to avoid disclosing operations of individual companies.

[44]Data for 32313 have been combined with 32113, shown as part of 3211, and excluded from 3231. Separate totals are withheld to avoid disclosing operations of individual companies.

[45]Product class 35195 is combined with product class 35197 to avoid disclosing operations of individual companies.

[46]Individual product codes included in product class for 1972 differ significantly from codes for prior year. Products shifting into or out of product class represent more than 15 percent of total U.S. value shipped.

[47]For 1967 and 1963, product class 35234 was combined with product class 35237 to avoid disclosing operations of individual companies.

[48]Individual product codes included in product class for 1972 differ from the codes for 1967. Products shifting into or out of this product class represent approximately 12 percent of total 1967 shipments.

[49]For 1963 and earlier, parts were included with applicable product classes.

[50]For 1972, product class 35230 includes data not specified by kind for industry 3524.

[51]Product class structure of industry changed significantly between 1976 and 1977; 1977 data are not comparable with data for prior years. Industry 3524 was created for 1972 (being formerly a part of industry 3522); thus, no comparable data prior to 1972 exist.

[52]For 1976 and prior years, data for portable water well and blast hole drilling rigs were contained in either product class 35319 or 35334. For 1977, data for these rigs were contained in product class 35334 only.

[53]For 1976 and prior years, data for product classes 35353 and 35355 were combined.

[54]For 1976 and prior years, data for product classes 35354 and 35356 were combined.

[55]Individual product codes included in this product class for 1972 differ from 1967 definition. Products shifting into or out of this product class represent approximately 10 percent of total 1967 shipments at U.S. level.

[56]For 1972 and later years, data for automatic stacking machines and parts and attachments for automatic stacking machines were included in product class 35362. Prior to 1972, data for these products were included in industry 3537 and were not available separately.

[57]For 1967 and later years, diecasting dies (molds) were included in product class 35442. Prior to 1967, these molds were included in product class 35441.

[58]For 1977, chain saws and parts were classified in industry 3546. Prior to 1977, chain saws and parts were classified in industry 3553.

[59]Prior to 1977, hydraulic and internal combustion engine driven hand tools and parts (excluding chain saws and parts) were classified in industry 3546, but not collected separately.

[60]Prior to 1972, product class 35490 included product classes 35460 and 35470.

[61]Prior to 1977, data for product class 35492 were combined with product class 35495.

[62]Prior to 1977, chain saws, hand held, were included in product class 35531. Data for 1972, 1967, and 1963 have been adjusted to exclude value of chain saws. Data are not available on a comparable basis for 1973, 1974, 1975, and 1976.

[63]Data for 1972 and later are not strictly comparable to prior years.

[64]Prior to 1972, parts for air and gas compressors were included with parts for pumps.

[65]Prior to 1972, values for 35610 includes values for 35630.

[66]For 1963 and earlier years, rebuilt carburetors were included with product class 35994.

[67]For 1963 and earlier years, parts were included with product class 35990.

[68]Prior to 1977, parts were included with data for complete units.

[69]Prior to 1972, value of products not specified by kind (n.s.k.) for industries 3646 and 3648 were included in industry 3645.

[70]Prior to 1967, figures for Product Class 37114, Combat Vehicles, and Product Class 37110, Motor Vehicles, n.s.k., were included with Product Class 37140, Motor Vehicle Parts and Accessories, N.S.K.

[71]Prior to 1967, figures for Product Class 37115, Passenger Car Bodies, were included with Product Class 37141, Motor Vehicle Parts and Accessories.

[72]Prior to 1977, Industry 3716, Motor Homes Produced on Purchased Chassis, were included in Product Class 37132, Motor Vehicles Built on Purchased Chassis. Data for 1972 have been revised to exclude motor homes.

[73]For 1967 and 1963, golf carts, self-propelled, were included in industry 3751.

[74]For 1977 and 1972, industry 3792 products were equivalent to sum of 1967 product codes 37910 31 through 37910 41 and 37991 21.

[75]For 1977, product class 37921 products were equivalent to sum of 1967 product codes 37910 31, 37910 33, 37910 35, and part of 37991 21, where travel trailers less than 11 feet in length were reported. For 1972, they were equivalent to sum of 1972 product class 37921 and part of product code 37922 41, where travel trailers less than 11 feet in length were reported.

[76]For 1977, product class 37922 products are equivalent to sum of 1967 product code 37910 41 and part of 37991 21, where collapsible camping trailers were reported. For 1972, they were equivalent to 1972 product class 37922 less part of product code 37922 41, where travel trailers less than 11 feet in length were reported.

[77]For 1972 and prior years, includes n.s.k. for industry 2451.

[78]For 1977 and 1972, product class 37994 was equivalent to 1967 product code 37922 93.

[79]Prior to 1972, this industry was published as two separate industries: 3871, Watches and Clocks; and 3872, Watchcases.

Note: See appendix F for definitions of standard metropolitan statistical areas (SMSA's) and standard consolidated statistical areas (SCSA's).

(D) Withheld to avoid disclosing operations of individual companies. (NA) Not available. (Z) Less than 50 thousand dollars or hours; under 50 employees.

[1] Including administrative offices and auxiliaries (for definition, see appendix A).

[2] Aggregate cost of materials and value of shipments for all manufacturing industries includes extensive duplication, since products of some industries are used as materials by others (see appendix A).

(D) Withheld to avoid disclosing operations of individual companies.

[1]For explanation of terms, see appendix A.

[2]A description of the standard error of estimate is given in appendix B under qualifications of the data. The percentage standard errors shown are the approximate relative standard errors of the estimates of level.

[3]Total figures may differ slightly from summation of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State. Data are for operating manufacturing establishments and exclude information for administrative offices and auxiliaries.

[1]Total figures may differ slightly from summation of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State.

[2]Includes administrative offices and auxiliaries.

[3]Aggregate of cost of materials and value of shipments for industry groups and for all manufacturing industries includes extensive duplication, since products of some industries are used as materials by others.

Table 3b. Gross Book Value of Depreciable Assets, Capital Expenditures, Retirements, Depreciation Charges, and Rental Payments for Buildings and Machinery for States: 1977

(All figures in millions of dollars except where noted. For explanation of terms, see appendix A. For description of annual survey of manufactures and estimating procedures used, see appendix B)

RENTAL PAYMENTS.	8.8	(3.2)	5.6	11	4.1	(.9)	3.2	6

Note: Expenditures data, shown in table 3a, are census universe figures and may differ from ASM sample estimates shown in this table. Table 3b figures represent best estimate of year-to year change as measured by continuing ASM sample, but are subject to sampling errors. Hence, as estimates of level, they are not as reliable as universe figures.
Figures in parentheses have standard errors of 15 percent or more. (S) Withheld because the estimate did not meet publication standards.

[1]For description of the standard error of estimate, see the section "Qualifications of the Data" in appendix B.
[2]Total figures may differ slightly from sum of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State.

Table 3c. **Cost of Purchased Services by State: 1977**

	Repair of buildings			Repair of machinery			Communication services		
	Cost (million dollars)	Response coverage ratio	Standard error of estimate (percent)	Cost (million dollars)	Response coverage ratio	Standard error of estimate (percent)	Cost (million dollars)	Response coverage ratio	Standard error of estimate (percent)

Note: Figures in parenthesis have standard errors of 15 percent or more. Figures are estimates collected on the continuing ASM sample and, as such, are subject to sampling errors.

(A) Indicates standard errors of 100 percent or more. These estimates are of limited reliability and should be used with caution.
(NA) Not available.

[1]Total figures may differ slightly from summation of the individual States due to the inclusion of a few establishments at the United States total level that could not be accurately coded to a State.

Table 4. Distribution of Establishments, by Employment Size Class and Major Industry Group, for States: 1977

(Major groups descriptions are: 20--food and kindred products; 21--tobacco manufactures; 22--textile mill products; 23--apparel and other textile products; 24--lumber and wood products; 25--furniture and fixtures; 26--paper and allied products; 27--printing and publishing; 28--chemicals and allied products; 29--petroleum and coal products; 30--rubber and miscellaneous plastics products; 31--leather and leather products; 32--stone, clay, and glass products; 33--primary metal industries; 34--fabricated metal products; 35--machinery, except electrical; 36--electric and electronic equipment; 37--transportation equipment; 38--instruments and related products; 39--miscellaneous manufacturing industries. For explanation of terms, see appendix A)

2b. Federal, State, and District of Columbia Penitentiaries—Production by Geographic Areas and Industry: 1977 and 1972 16

EXPLANATORY TEXT

GENERAL

This report presents data on the manufacturing activities of selected government establishments in the United States. The data are not included in other 1977 Census of Manufactures reports, which cover only privately operated establishments. Manufacturing establishments owned by the Federal Government and operated by private companies, either for the government or on their own account, are included with privately operated establishments.

Three types of U.S. Government manufacturing establishments are recognized for this report: (1) Department of Defense facilities, (2) Federal, State, and District of Columbia penitentiaries, and (3) other U.S. Government facilities. Data are shown for the first two types; the third is discussed in the text.

The data for department of Defense facilities were collected on Census report form MA-171, and for penitentiaries on MD-D4. The data are presented by industry groups as defined in the 1972 SIC manual[1]. The data are also presented by geographic areas—The United States, geographic divisions, States, and standard metropolitan statistical areas. (SMSA's are defined in appendix B.)

The data were prepared with the cooperation of the Department of Defense, Department of Justice, Department of Interior, and State and District of Columbia penal systems.

DEPARTMENT OF DEFENSE FACILITIES

Coverage

Data on Department of Defense manufacturing facilities were collected from 88 establishments and are shown in tables 1a, 1b, and 1c. Although these establishments may also be engaged in nonmanufacturing activities at the same location, the statistics represent only their manufacturing activities. All manufacturing installations producing goods or performing manufacturing services are included, such as industrial research and development and the conversion and modification of ships and aircraft by the Army, Navy, and Air Force. However, activities of Defense Department installations primarily or exclusively serving their own installations are not included, such as bakeries and some machine shops. Also not included are all printing and publishing activities. Coverage of printing and publishing activities is difficult because almost every large government installation engages in these activities to some degree.

Findings

Total revenue at Department of Defense manufacturing facilities amounted to $8.3 billion in 1977 as compared with $8.0 billion in 1976 and $7.1 billion in 1972. In 1977, total employment was 234.2 thousand of which 139.0 thousand were production workers. The wages of all employees totaled $4.4 billion; and those of production workers, $2.5 billion.

Explanation of Terms

In this survey, "wage board and graded" employees refer to those nonmilitary personnel employed by Department of Defense owned-and-operated establishments. "Costs" represent the cost of materials, supplies, and parts used; the cost of contractual services; and other costs directly related to the manufacturing activities of the installation. "Value of shipments for service" represents total billings (including progress billings) based on the Industrial Fund Accounting System of the Department of Defense, including receipts for construction and conversion, manufacture and assembly, and research and development. Unbilled costs of work in progress are reported separately. "Total revenue" represents total billings adjusted by the increase or decrease in the unbilled costs of work in progress. "Value added by manufacture" is represented two ways: In tables 1a-1c, data are shown for revenue less cost of materials and for revenue less cost of materials, contractual service, and other costs. (Note that prior to 1970 "value added" represented total revenue less cost of materials.)

FEDERAL, STATE, AND DISTRICT OF COLUMBIA PENITENTIARIES

Data were collected on Federal, State, and District of Columbia penal systems and are shown in tables 2a and 2b. During 1977, manufactured products valued at $272.8 million were produced at penitentiaries in the United States, of which $90.9 million worth was produced at Federal penitentiaries. The comparable 1972 data were $172.2 million in manufactured products, of which $56.3 million worth came from Federal peniteniaries. These data include the value of products manufactured for use within the institutions, products transferred to other government agencies, or products for sale in the open market. Tables 2a shows 1977 and 1972 production data by industry group, and table 2b shows total production data by States and industry.

[1] **Standard Industrial Classification Manual: 1972.** For sale by Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Stock No. 4101-0066. Price $6.75. **1977 Supplement.** Stock No. 003-005-00176-0. Price 90 cents.

OTHER U.S. GOVERNMENT FACILITIES

No data are shown in this report on the production of other U.S. Government manufacturing facilities, such as the Bureau of Mines of the U.S. Department of Interior, which is the primary producer of refined helium in the United States. During 1977, it operated two plants from which 219.5 million cubic feet of helium valued at $7.7 million were shipped. Its average number of employees totaled 253, of which 152 were production and related workers. The total wages and salaries it paid amounted to approximately $5.0 million. Comparable data for other years, as well as additional details on production, shipments, consumption, prices, reserves, and activities relating to conservation and technology, appear in the Bureau of Mines' "Minerals Yearbook for 1977".

Other government agencies whose manufacturing activities are not covered in this report are the Government Printing Office, The National Aeronautic and Space Administration, and the Tennessee Valley Authority. The operation of these agencies are covered in their annual reports. Others not covered are the minor manufacturing activities of the Post Office Department and the General Services Administration.

20. Carpet and Rug Weaving Looms and Machinery: June 30, 1978 and December 31, 1973. 15
21. Carpet Yarn Heatsetting Machinery: June 30, 1978 16

EXPLANATORY TEXT

GENERAL

This report supplements the 1977 Census of Manufactures data shown for SIC Major Group 22, Textile Mill Products, in the industry reports series. The data included in this report were collected in an independent survey through a mail canvass on Census Form MC-22Z, Textile Machinery in Place as of June 30, 1978, as part of the 1977 Census of Manufactures .

SCOPE OF SURVEY

The manufacturing establishments reporting in this survey are defined as a single physical location where manufacturing operations are performed (e.g., a factory, mill, or plant). They were selected from the 1977 Census of Manufactures mailing panel for specific textile industries as defined and structured in the 1972 edition of the Standard Industrial Classification (SIC) Manual, published by the Office of Management and Budget, Executive Office of the President. The specific industries included cover the major textile operations, as follows: Yarn spinning (SIC 2281 and 2283), yarn texturing and throwing (SIC 2282), weaving (SIC 2211, 2221, 2231 and 2241), knitting (SIC 2251, 2252, 2253, 2254, 2257, 2258, and 2259), yarn and fabric finishing (SIC 2261, 2262, and 2269), tire cord and tire cord fabric (SIC 2296), nonwoven fabrics (SIC 2297), and carpet and rugs (SIC 2271, 2272, and 2279). Since a portion of textured yarn is also produced by chemical companies manufacturing filament yarn (SIC 2823 and 2824), respondents were also selected from these operations. However, the machinery in place at coated fabric plants (SIC 2295) were excluded from this survey.

METHOD OF OPERATION

The textile industries are characterized by several major types of business activities: Manufacturers, contractors, jobbers, converters, wholesalers, and piece-goods dealers.

The "manufacturer" purchases materials, employs production workers in his own plant to produce the product, and sells the product; in effect, this establishment performs all of the usual manufacturing functions.

The "contractor" employs productions workers in his own establishment to process materials owned by other companies (independent contractors) or supplied by other establishments of the same company (multiplant company contractor), makes products to specification, and is not involved in the sale of the finished product.

The "jobber", "converter", "wholesaler", and "piece-goods dealer" primarily perform only the entrepreneurial functions of the textile business, such as buying raw materials, designing and preparing samples, arranging for the manufacture of products from owned materials with contractors, and marketing the finished product.

The reporting establishments were asked to indicate their type of business (manufacturer, contractor, or jobber) and the kinds of operations (spinning, weaving, etc.) performed at each manufacturing location. Since there is a large degree of integrated or vertical operations within the establishments in the textile industries, each respondent received a complete copy of the report form including all machinery descriptions collected in this report. This gave the respondent the opportunity to report the machinery in place for all operations performed at the plant location. The information concerning the type of business and kind of operation of the respondent was then cross-checked against the type of machinery reported by that respondent to ensure a complete and full report from each reporting unit. Basically, the majority of the machinery-in-place data shown in this report are located at manufacturing and contracting establishments. However, only the jobbers within the knitting industries were mailed report forms since they are considered within the scope of the census of manufactures. All other jobbers, wholesalers, converters, and piece-goods dealers were excluded from the mailing panel of this survey.

All respondents were asked to report the number of machines in place. For the purpose of this report, "in place" includes all machinery set up in operating positions even though the machinery may have been idle on June 30, 1978. In addition, the respondents were also asked to include sample machinery.

SURVEY COVERAGE

As a means of evaluating the coverage of this information, the employment figures for those establishments responding to our survey were tabulated by four-digit SIC industries in which the responding establishments are classified. The total employment figure of the reporting establishments of each four-digit SIC industry was then compared to the total employment figure of the respective four-digit SIC industry as shown in the 1977 Census of Manufactures preliminary industry reports. The figures presented in this report are simple aggregates of reported data from companies representing approximately 90 percent of total employment in the industries covered by this survey. The reporting percentage shown above may be slightly higher or lower in some cases as a result of plants that were out of scope of this survey or out of business and had sold or dismantled their equipment during 1978. These plants were counted as reporting establishments, and their employment data were used in the computation of the reporting percentage. Also, an attempt was made to contact any known successors to the

plants that went out of business during 1978. Conversely, several multiplant companies had new plants come into business during 1978 and they were reported to us. Although the data for the successor establishments and new plants are included in the tables, they had no employees in 1977 and, therefore, could not be included in the reporting percentage.

COMPARABLE CURRENT INDUSTRIAL REPORTS SERIES DATA

The data for selected types of machinery in place are also collected in the Current Industrial Reports (CIR) series of the Census Bureau. Reference is made in footnotes of each table, where applicable, to indicate the appropriate CIR series containing the comparable machinery-in-place data.

COMPARABLE PRIOR CENSUS OF MANUFACTURES DATA

Similar textile machinery-in-place data were shown in previous census of manufactures publications. Volume II, Industry Statistics, Part 1, Major Groups 20 to 28 of the 1972, 1963, and the 1958 Censuses of Manufactures included textile machinery-in-place data for selected years between 1954 and 1965. Where applicable, selected comparable figures from these publications are shown in the tables of this report.

Table 1. Cotton System Machinery for Preparation of Cotton and Manmade Fiber and Spun Yarn: June 30, 1978 and December 31, 1973

(Data are aggregates of reported data from companies representing approximately 90 percent of total employment in industries covered by survey)

Type of machinery	Unit of measure	Machinery in place June 30, 1978	Machinery in place Dec. 31, 1973
Automated bale open machinery	Number	376	(NA)
Automated blending machinery	Number	2,504	(NA)
Pickers	Number	1,814	2,944

Table 12. Narrow Fabric Weaving Looms by Type of Loom: June 30, 1978

(Data are aggregates of reported data from companies representing 90 percent of total employment in industries covered by survey)

Type of loom	Total looms	Shuttle type	Shuttleless type
Narrow fabric weaving looms[1]	8,800	3,801	4,999
Tape looms	5,785	2,777	3,008
Webbing looms	3,015	1,024	1,991
Light and/or medium weight	2,531	737	1,794
Heavy weight	328	(D)	(D)
Extra weight	156	(D)	(D)

Note: Data for narrow fabric looms in place are collected on an annual basis and published in Current Industrial Reports, series MA-22G, "Narrow Fabrics."

(D) Withheld to avoid disclosing operations of individual companies.

[1]Looms 12 inches and under.

Table 13. **Knitting Machinery: June 30, 1978 and December 31, 1973**

(Data are aggregates of reported data from companies representing approximately 90 percent of total employment in industries covered by survey)

Type of machinery	Machinery in place	
	June 30, 1978	Dec. 31, 1973
Weft knitting machines:		
Garments, trims and collars:		
Flat bar	6,232	6,825
V-bed flat latch needle	4,333	4,486
Flat-bed purl, or links and links	1,104	1,592
Multisection spring needle full fashioning	795	747
Cylinder and dial	3,293	
Circular lengths	2,701	6,430
Rib	1,925	
Interlock	776	
Circular headwear and other small diameter machines, excluding hosiery and knit deknit	1,516	4,234
Yard goods, outerwear, underwear, and industrial:		
Circular open top latch needle machines:		
Plain:		
64 feeds and under	5,943	
65 to 96 feeds	731	
Over 96 feeds	100	
Multiple track:		
64 feeds and under	726	
65 to 96 feeds	536	9,043
Over 96 feeds	112	
Patterned jersey:		
64 feeds and under	2,012	
65 to 96 feeds	140	
Over 96 feeds	86	
Sliver knit	512	836
Circular spring needle machines	2,423	5,219
Cylinder and dial machines:		
Interlock	3,692	4,712
By cut:		
18 and under	1,826	(NA)
22 to 24	1,265	(NA)
28 and over	601	(NA)
Weft knitting machines--Con.		
Yard goods, outerwear, underwear, and industrial--Con.		
Cylinder and dial machines--Con.		
Interlock--Con.		
By feed:		
64 feeds and under	3,161	(NA)
65 to 96 feeds	482	(NA)
Over 96 feeds	49	(NA)
Rib body size underwear machines	4,282	5,889
Double knit, including eight lock	8,266	15,590
By type:		
No pattern mechanism	1,870	3,712
Fixed selection, including patterns limited to one machine revolution	2,146	1,864
Patterning device, mechanical and electronic (more than one machine revolution)	4,250	10,014
By cut:		
18 and under	5,064	(NA)
22 to 24	2,499	(NA)
28 and over	703	(NA)
By feed:		
64 feeds and under	7,450	(NA)
65 to 96 feeds	766	(NA)
Over 96 feeds	50	(NA)
Purl or links	281	490
Warp knitting machines:		
Tricot (spring beard, latch, and compound needle)	4,431	5,537
Raschel (latch and compound)	2,248	2,852
Raschel-crochet	267	514
All other, including ketten raschel, simplex, weft insertion, milanese, and loop vending	818	362

Note: For 1978 knitting machinery in place were collected on a quarterly basis and published in Current Industrial Reports series MQ22K, "Knit Fabric Production."

(NA) Not available.

Table 14. Textile Finishing Machinery: June 30, 1978 and December 31, 1973

(Data are aggregates of reported data from companies representing approximately 90 percent of total employment in industries covered by survey)

Type of machinery	Machinery in place	
	June 30, 1978	December 31, 1973
Preparatory machinery:		
Scouring and bleaching ranges	899	1,343
Rope	348	389
Open width	305	408
Other	246	546
Mercerizing ranges	69	98
Dyeing machinery:		
Raw stock and bale dyeing machines	344	419
Yarn dyeing machines	2,413	2,912
Package yarn	1,070	1,436
Beam	582	455
Continuous	102	43
Skein	520	816
Other	139	162
Batch fabric dyeing machines	5,629	9,017
Jigs	1,128	1,957
Padders	322	537
Becks (boxes, winches, dye kettles, etc):		
Atmospheric type	2,240	3,918
Pressure type	314	740
Jet	1,079	727
Beam	359	1,138
Other	187	
Carpet dyeing machines	685	(NA)
Beck	655	(NA)
Continuous	30	(NA)
Garment dyeing machines	1,123	(NA)
Rotary	562	(NA)
Paddle	561	(NA)
Continuous dyeing ranges	264	295
Thermosol-pad-steam	115	132
Other continuous	149	163
Printing machinery:		
Roller printing machines	259	394
Less than 70 inches	239	394
70 inches and over	20	

Type of machinery	Machinery in place	
	June 30, 1978	December 31, 1973
Printing machinery--Con.		
Screen printing machines	354	515
Flat screen, flat bed machines	153	211
For carpet	13	211
For other than carpet	140	
Rotary screen, flat bed machines	167	136
Under 60 inches	25	136
60 to 89 inches	98	
90 to 119 inches	27	
120 inches and over	17	
Other	34	168
Continuous piece goods heat transfer printing machines	43	59
Other	71	40
Selected finishing machinery:		
Compressive shrinkage machines	386	535
For woven fabrics	264	368
For knit fabrics	122	167
Tenter frames	1,391	1,684
Clip	654	823
Pin	693	762
Pin-clip combination	44	99
Solvent processing units (batch and continuous)	117	196
Decating	156	288
Fulling mills	228	(NA)
Surface finishing machinery:		
Napping	867	(NA)
Shearing	540	(NA)
Brushing, sueding and sanding	411	(NA)
Embossing	89	(NA)
Calendaring	726	1,054
Corduroy and velveteen cutting machines	451	(NA)

(NA) Not available.

EXPLANATORY TEXT

SUMMARY DATA

In 1977 the U.S. consumption of purchased fuels and electric energy for heat and power by manufacturing establishments totaled 12.9 quadrillion British thermal units (Btu's). This represented a 1 percent increase over the 1976 consumption figure of 12.8 quadrillion Btu's, which was considerably lower than the 6.2 percent increase in the Federal Reserve Board's (FRB) index of manufacturing production for that period. From these statistics it appears that proportionately less energy is being consumed in the production of manufactured goods. Apparently, fuel shortages and resulting efforts to save energy have changed the historic correlation between levels of production and energy consumption.

Expenditures during 1977 by manufacturers for fuels and electric energy amounted to $33.4 billion, an increase of 19 percent over the 1976 total of $28.1 billion (chart 1). Manufacturers' expenditures in 1977 for natural gas totaled $8.9 billion, an 18 percent increase over the 1976 level of $7.5 billion. Purchased electric energy costs increased 19 percent from $12.2 billion in 1976 to $14.5 billion in 1977, while those for fuel oil increased 23 percent to a 1977 level of $4.9 billion. Expenditures for coal increased by 11 percent between 1976 and 1977 to $1.5 billion, while for coke and breeze they increased 22 percent from the revised 1976 figure of $1.4 billion to $1.8 billion in 1977 (chart 2). All dollar figures in this report are in current dollars and therefore are not adjusted for changes in price levels.

While overall energy consumption between 1976 and 1977 showed only a modest increase, some variations in the mix of the fuel types and electric energy occured (chart 3). Increases in consumption were recorded for each of the major fuels and purchased electric energy except natural gas. Consumption of gas declined 5 percent from the 1976 level. This decrease caused the proportion of total natural gas consumed to slide to 46 percent of all manufacturing energy usage during 1977. Although natural gas remains the dominant fuel used by manufacturers, its percent of total energy usage has dropped significantly from the 1971 level of 56 percent. This shows the increasing switch from natural gas to the other major fuels and electric energy, particularly to residual fuel oil (table A and chart 4).

The average cost per million Btu's of energy consumed in 1977 was $2.58, a 17 percent increase over the 1976 average cost. This increase, more than the 14 percent increase between 1975 and 1976, was considerably lower than the average annual increase of 25 percent between 1971 and 1975. The increased average cost per million Btu's resulted primarily from an increased unit cost of natural gas, which rose to $1.55 per million Btu's. This was a 24 percent jump over the 1976 average cost of $1.26 per million Btu's. Lesser increases in average unit cost were registered by each of the other major fuels and electric energy. Again in 1977, coal remained the lowest cost fuel (on a Btu-per-dollar basis) of any of the major fuels covered in this report (table B and chart 5). Chart 6 illustrates the sharp increase in unit costs of selected fuels and electric energy consumed by all manufacturing industries during 1967-1977.

Although purchased electric energy accounted for 17 percent of the total energy consumed by manufacturers, it accounted for 43 percent of total energy expenditures. While natural gas accounted for 46 percent of total energy used (chart 4), it accounted for only 27 percent of total expenditures, making it a considerably lower priced source of energy than electricity in terms of Btu's. This Btu computation assumes perfect conversion of various fuels into energy, which in practice does not occur. Thus, a decrease in fuel consumption with a corresponding increase in purchased electric energy will result in a lower Btu figure to the extent that conversion losses are shifted to a public utility.

Table A. Percent of Total Energy Consumed by All Manufacturing Industries for Selected Fuels and Purchased Electric Energy: 1967, 1971, and 1974-1977

(Data for fuels not specified by kind were distributed among detailed fuels)

Fuels and electric energy	1977	1976	1975	1974	1971	1967
Total	100	100	100	100	100	100
Residual fuel oil	12	12	10	9	7	7

Btu British thermal units.

INDUSTRY DATA

At the 2-digit Standard Industrial Classification (SIC) level, purchased fuels and electric energy consumption increased in 17 of the 20 major industry groups and decreased slightly in the other 3 groups (table C). The largest decrease was in major group 24, Lumber and Wood Products, which showed a 3 percent drop, reflecting a decrease of 8.0 trillion Btu's from 1976. Those with the largest absolute increase in fuels and electric energy consumption in trillions of Btu's were major group 33, Primary Metal Industries; 32, Stone, Clay, and Glass Products; and 30, Rubber and Miscellaneous Plastics Products. The groups that recorded the largest percentage increase were major group 30, Rubber and Miscellaneous Plastics Products (9 percent); 23 Apparel and Other Textile Products (6 percent); and 25, Furniture and Fixtures (6 percent).

Between 1976 and 1977, the average cost per Btu of purchased fuels and electric energy increased in all 20 2-digit major industry groups. The largest increase (19 percent) was recorded in major group 28, Chemicals and Allied Products. This was caused primarily by an increased average cost of natural gas.

In 1977, as in 1976, 1975, and 1974, major industry groups 27, Printing and Publishing, and 23, Apparel and Other Textile Products, recorded the highest average cost per million Btu's: $4.57 and $4.36 respectively. Electric energy accounts for a relatively high percentage of energy consumed by establishments in these two industry groups.

Energy consumption in manufacturing is highly concentrated among a few industries that are energy intensive because of their use of large amounts of energy in manufacturing processes (rather than mainly for heat and light). SIC industry 3312, Blast Furnances and Steel Mills, consumed 1,519 trillion BTU's, making it the largest energy-consuming industry in manufacturing. Other major energy-consuming industries in descending order of consumption were 2911, Petroleum Refining (1,223 trillion); 2869, Industrial Organic Chemicals, not elsewhere classified (1,096 trillion); and 2621, Papermills, Except Building Paper (588 trillion). These four industries accounted for 34 percent of the total energy consumption of all 449 manufacturing industries (charts 7 and 8 and table D).

REVISIONS TO 1976 COKE AND BREEZE DATA

Data on the consumption of purchased coke and breeze before 1976 are not fully comparable with the data for 1976 and 1977.

During review of the 1977 Census of Manufactures data on the production and disposition of coke and breeze, it became evident that the amount of purchased coke consumed as a fuel was understated for some establishments. This occurred because some respondents misinterpreted instructions for reporting coke consumption. Correct 1977 data were obtained and the 1976 figures for purchased coke and breeze were adjusted to reflect the true consumption picture. These adjustments increased 1976 quantity and cost figures for coke and breeze (table E). It is not possible to develop comparable consumption figures for earlier years. However, the magnitude of the 1976 revisions gives a good indication of the probable impact on the 1974 and 1975 figures.

CHART 8.

Fuels and Purchased Electric Energy Consumed by 8 Largest Consuming Industries: 1974-1977

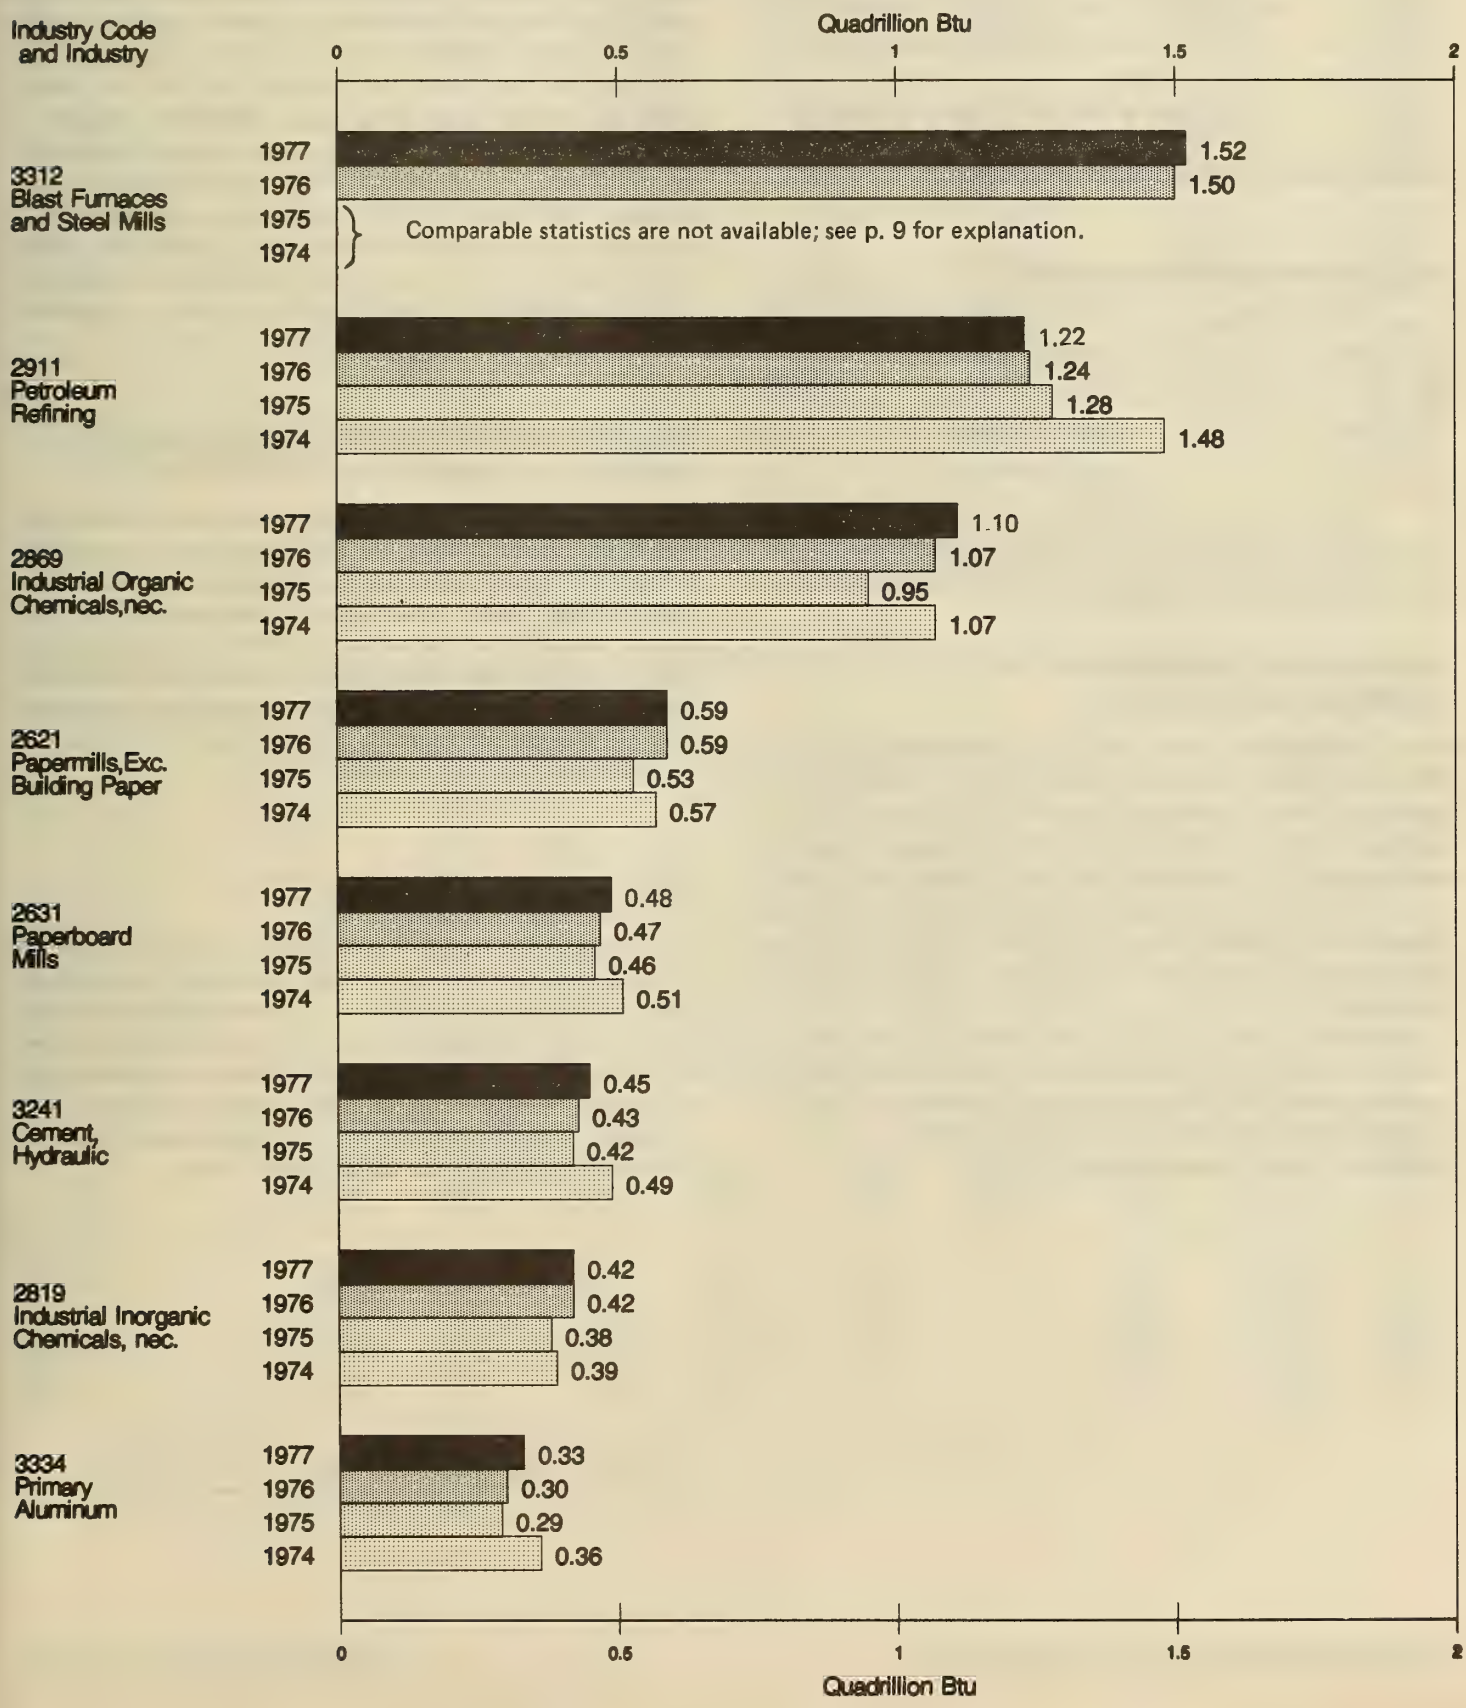

Table E. **Revisions to 1976 Coke and Breeze Statistics**

Fuel	Published 1976		Revised 1976	
	Quantity (1,000 s. tons)	Cost (mil. dol.)	Quantity (1,000 s. tons)	Cost (mil. dol.)
	All industries			
Coke and breeze.....	15,665.7	1,141.2	18,536.0	1,437.2
	Industry 3312, Blast furnaces and steel mills			
Coke and breeze.....	13,031.4	879.9	15,447.1	1,115.7

Table F. **Conversion to British Thermal Units: 1977**

Kind of energy	Unit of measure	Btu's (1,000)
Electric energy.	1,000 kWh	3,412
Coal	Short tons.	26,194
Coke	. . do.	25,993
Fuel oil:		
Distillate	Barrels (42-gal.) .	5,824
Residual	. . do.	6,285
Natural gas.	MCF (1,000 cu. ft.)	1,024
Other fuels.	Dollars	478

Note: For costs of "fuels, not specified by kind," conversion factors for 1977 were developed for each 2-digit SIC group, based on the relationship of total cost of fuels to the total kilowatt-hour equivalents for those groups, as published in M76(AS)-4.1, "Fuels and Electric Energy," 1976 Annual Survey of Manufactures.

CONVERSION TO BRITISH THERMAL UNITS (BTU'S)

Fuels consumed data were converted to British thermal units (BTU's) to provide comparable figures (table F). A Btu is the quantity of heat required to raise the temperature of one pound of water by 1 degree Fahrenheit. Btu factors reflect the energy content of the various fuels with no regard to efficiency of use. Since some fuel applications are considerably more efficient than others (none 100 percent efficient), the Btu figures must be considered as the maximum amount of available energy.

Beginning in 1976, the Btu rather than the kilowatt-hour equivalent was used as the common unit of measure for this statistical series. Several data users recommended the adoption of Btu's as the standard for energy quantification. There are 3,412 Btu's in one kilowatt-hour equivalent.

FUELS EXCLUDED FROM REPORT

Data on fuels produced and consumed in the same establishment, such as coke-oven gas or blast-furnaces gas; data on fuels used as raw materials, such as fuel oil and natural gas used to produce carbon black and crude petroleum used to produce fuels; and fuels converted to other fuel types, such as coal converted to coke, were not collected in the 1974, 1975, 1976, or 1977 surveys. As a result, significant amounts of energy materials used in manufacturing plants are not covered by this report. For example, in 1972 coke produced and consumed in SIC Industry 3312, Blast Furnaces and Steel Mills, amounted to 40.5 million short tons or 1.1 quadrillion Btu's. Inclusion of this coke would have increased the gross Btu's of fuels consumed by manufacturers by about 8 to 10 percent.

1972 AND 1977 REVISIONS TO STANDARD INDUSTRIAL CLASSIFICATION SYSTEM

A revised edition of the Standard Industrial Classification (SIC) manual was issued in 1972, the first major revision since 1957. In the 1972 version, extensive modifications were made in the manufacturing sector which affect comparability with the historic data in many industries. In 1977 a supplement to the 1972 SIC manual was issued presenting several minor additional changes to the classification system. More detailed descriptions of these changes are found in the 1972 and 1977 Census of Manufactures (MC72(1)-1 and MC77-SR-1).

CENSUS DISCLOSURE RULES

The Bureau of the Census is prohibited by law from publishing any statistics that would disclose information reported by individual companies. Additionally, quantity or cost data may be withheld if the figures do not meet publication standards on the basis of a consistency review. However, the total figures for a State, industry group, or major group include data for all component industries whether or not separate figures are shown for the individual industries comprising the total.

Table 1. Fuels and Electric Energy Used for Heat and Power: 1977 and Earlier Years

- Represents zero.
[1]Data are revised because of adjustments to estimating technique; see appendix G, Description of Survey Sample.
[2]Figures for residual fuel oil are included with distillate fuel oil.
[3]Figure includes manufactured, still, blast-furnace, and coke-oven gas.
[4]Figure includes gas, except natural gas.

Table 3. Quantity and Cost of Purchased Fuels and Electric Energy Used for Heat and Power by Industry Group and Industry: 1977 and 1976

(For explanation of terms, see appendix A)

SIC code	Industry group and industry	1977

- Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (S) Withheld because the estimate did not meet publication standards, either on the basis of the associated standard error of the estimate or on the basis of a consistency review. (X) Not applicable. (Z) Less than half of the unit of measure specified.

[1]Standard error of estimate is described in appendix G. Cost of fuels (col. D) and purchased electric energy (col. Q and R) were collected from all establishments in the 1977 Census of Manufactures. The figures shown for these items are census totals; therefore, sampling standard errors do not apply. Standard errors of estimates for the cost of coke for the 70 industries that reported this fuel and standard errors of estimates for "other fuels" are not shown in this table. Standard errors for "other fuels" are generally higher, and may sometimes be considerably higher than those for specified kinds of fuels for which standard errors of estimates are shown. Standard error for cost of coke consumed is less than 1 percent at "all industries" level. Estimated standard errors for the six most important coke consuming industries, which collectively account for 96 percent of total cost of coke consumed, are:

Industry	Standard error of estimate (percent)	Industry	Standard error of estimate (percent)
3296	3	3321	2
3312	1	3332	1
3316	1	3714	1

[2]Data presented in this table supersede 1976 published data. Data were revised as a result of adjustments to estimating technique. For a complete discussion of these adjustments see appendix G, Method of Estimation.

Table 4. Fuels and Electric Energy Used for Heat and Power by Industry Group and Industry: 1976 Revised

BUREAU OF THE CENSUS

EXPLANATORY TEXT

SUMMARY DATA

In 1977 the U.S. consumption of purchased fuels and electric energy for heat and power by manufacturing establishments totaled 12.9 quadrillion British thermal units (Btu's). This represented a 1 percent increase over the 1976 consumption figure of 12.8 quadrillion Btu's, which was considerably lower than the 6.2 percent increase in the Federal Reserve Board's (FRB) index of manufacturing production for that period. From these statistics it appears that proportionately less energy is being consumed in the production of manufactured goods. Apparently, fuel shortages and resulting efforts to save energy have changed the historic correlation between levels of production and energy consumption.

Expenditures during 1977 by manufacturers for fuels and electric energy amounted to $33.4 billion, an increase of 19 percent over the 1976 total of $28.1 billion (chart 1). Manufacturers' expenditures in 1977 for natural gas totaled $8.9 billion, an 18 percent increase over the 1976 level of $7.5 billion. Purchased electric energy costs increased 19 percent from $12.2 billion in 1976 to $14.5 billion in 1977, while those for fuel oil increased 23 percent to a 1977 level of $4.9 billion. Expenditures for coal increased by 11 percent between 1976 and 1977 to $1.5 billion, while for coke and breeze they increased 22 percent from the revised 1976 figure of $1.4 billion to $1.8 billion in 1977 (chart 2). All dollar figures in this report are in current dollars and therefore are not adjusted for changes in price levels.

While overall energy consumption between 1976 and 1977 showed only a modest increase, some variations in the mix of the fuel types and electric energy occured (chart 3). Increases in consumption were recorded for each of the major fuels and purchased electric energy except natural gas. Consumption of gas declined 5 percent from the 1976 level. This decrease caused the proportion of total natural gas consumed to slide to 46 percent of all manufacturing energy usage during 1977. Although natural gas remains the dominant fuel used by manufacturers, its percent of total energy usage has dropped significantly from the 1971 level of 56 percent. This shows the increasing switch from natural gas to the other major fuels and electric energy, particularly to residual fuel oil (table A and chart 4).

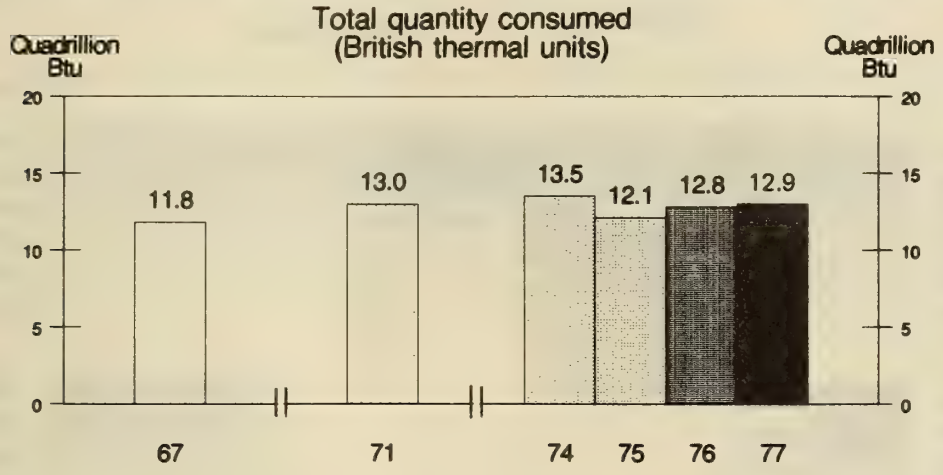
The average cost per million Btu's of energy consumed in 1977 was $2.58, a 17 percent increase over the 1976 average cost. This increase, more than the 14 percent increase between 1975 and 1976, was considerably lower than the average annual increase of 25 percent between 1971 and 1975. The increased average cost per million Btu's resulted primarily from an increased unit cost of natural gas, which rose to $1.55 per million Btu's. This was a 24 percent jump over the 1976 average cost of $1.26 per million Btu's. Lesser increases in average unit cost were registered by each of the other major fuels and electric energy. Again in 1977, coal remained the lowest cost fuel (on a Btu-per-dollar basis) of any of the major fuels covered in this report (table B and chart 5). Chart 6 illustrates the sharp increase in unit costs of selected fuels and electric energy consumed by all manufacturing industries during 1967-1977.

Although purchased electric energy accounted for 17 percent of the total energy consumed by manufacturers, it accounted for 43 percent of total energy expenditures. While natural gas accounted for 46 percent of total energy used (chart 4), it accounted for only 27 percent of total expenditures, making it a considerably lower priced source of energy than electricity in terms of Btu's. This Btu computation assumes perfect conversion of various fuels into energy, which in practice does not occur. Thus, a decrease in fuel consumption with a corresponding increase in purchased electric energy will result in a lower Btu figure to the extent that conversion losses are shifted to a public utility.

Table A. **Percent of Total Energy Consumed by All Manufacturing Industries for Selected Fuels and Purchased Electric Energy: 1967, 1971, and 1974-1977**

(Data for fuels not specified by kind were distributed among detailed fuels)

Fuels and electric energy	1977	1976	1975	1974	1971	1967
Total	100	100	100	100	100	100
Residual fuel oil	12	12	10	9	7	7
Bituminous coal, lignite, and anthracite	11	10	10	10	13	19
Coke and breeze	4	4	3	3	3	3
Distillate fuel oil	5	4	5	5	5	4
Natural gas	46	49	52	54	56	53
Purchased electric energy	17	17	17	15	13	12
Other fuels	4	4	4	3	2	1



Note: Detail may not add to 100 because of independent rounding.

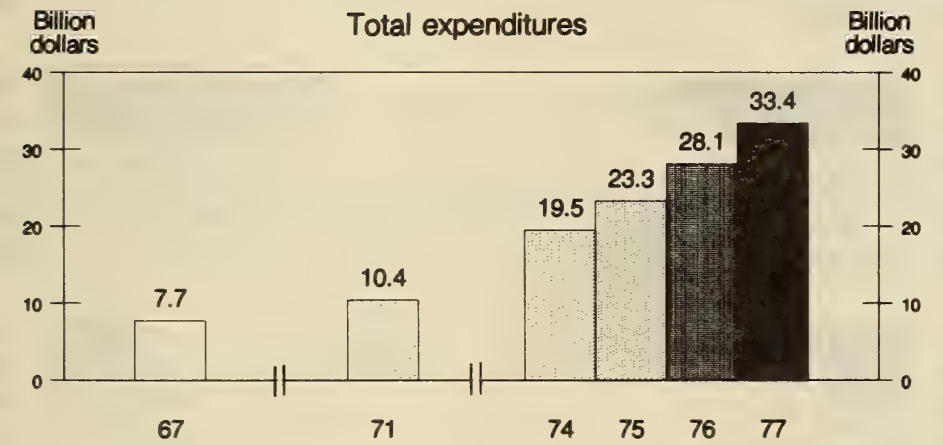


Table B. **Unit Cost and Index of Change of Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries: 1967, 1971, and 1974-1977**

Year	Total purchased fuels and electric energy	Natural gas	Bituminous coal, lignite, and Anthracite	Residual fuel oil	Distillate fuel oil	Coke and breeze	Purchased Electric energy
	UNIT COST (DOLLARS PER MILLION BTU)

Purchased Fuels and Electric Energy Quantity Consumed, Expenditures, and Unit Cost: 1967,1971, and 1974–1977

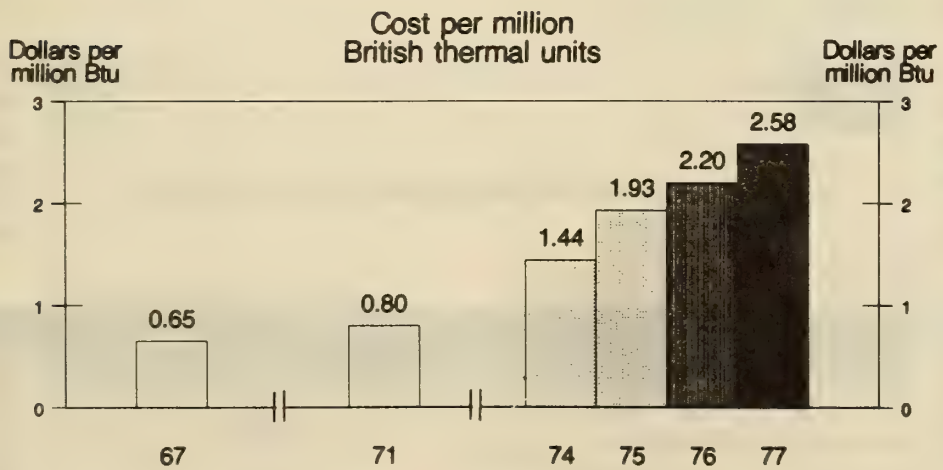

CHART 2.

Expenditures for Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries: 1967, 1971, and 1974–1977

(Excludes expenditures for Other Fuels and Fuels Not Specified by Kind, which for 1977 amounted to 3.2 and 2.3 percent of all fuel and electric energy expenditures by all manufacturing industries)

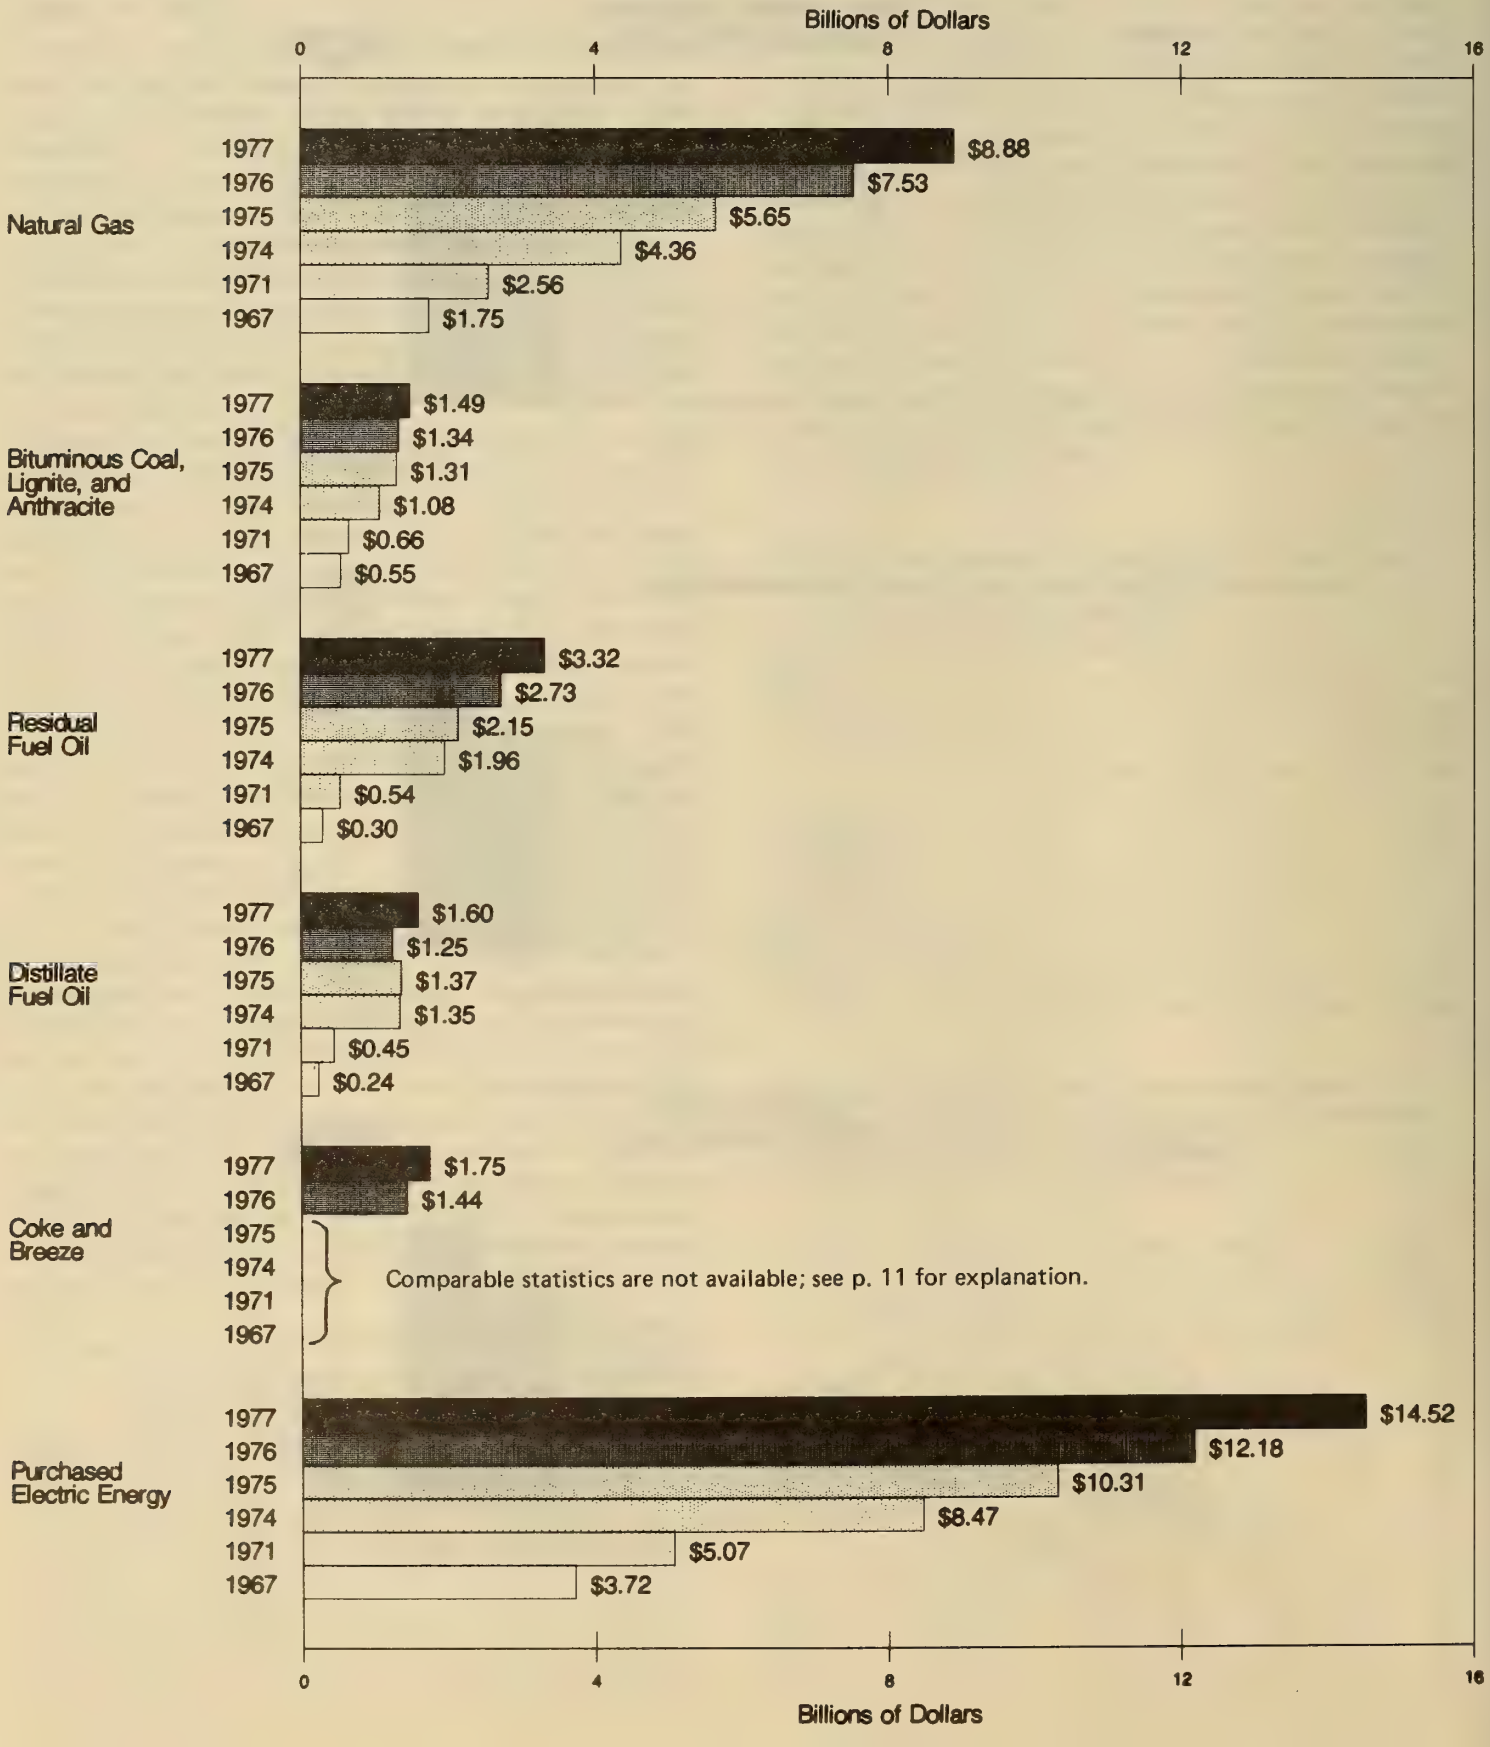

CHART 3.

Quantity of Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries: 1967, 1971, and 1974–1977

(Excludes consumption for Other Fuels and Fuels Not Specified by Kind, which for 1977 amounted to 4.8 and 4.4 percent of all fuel and electric energy consumption by all manufacturing industries)

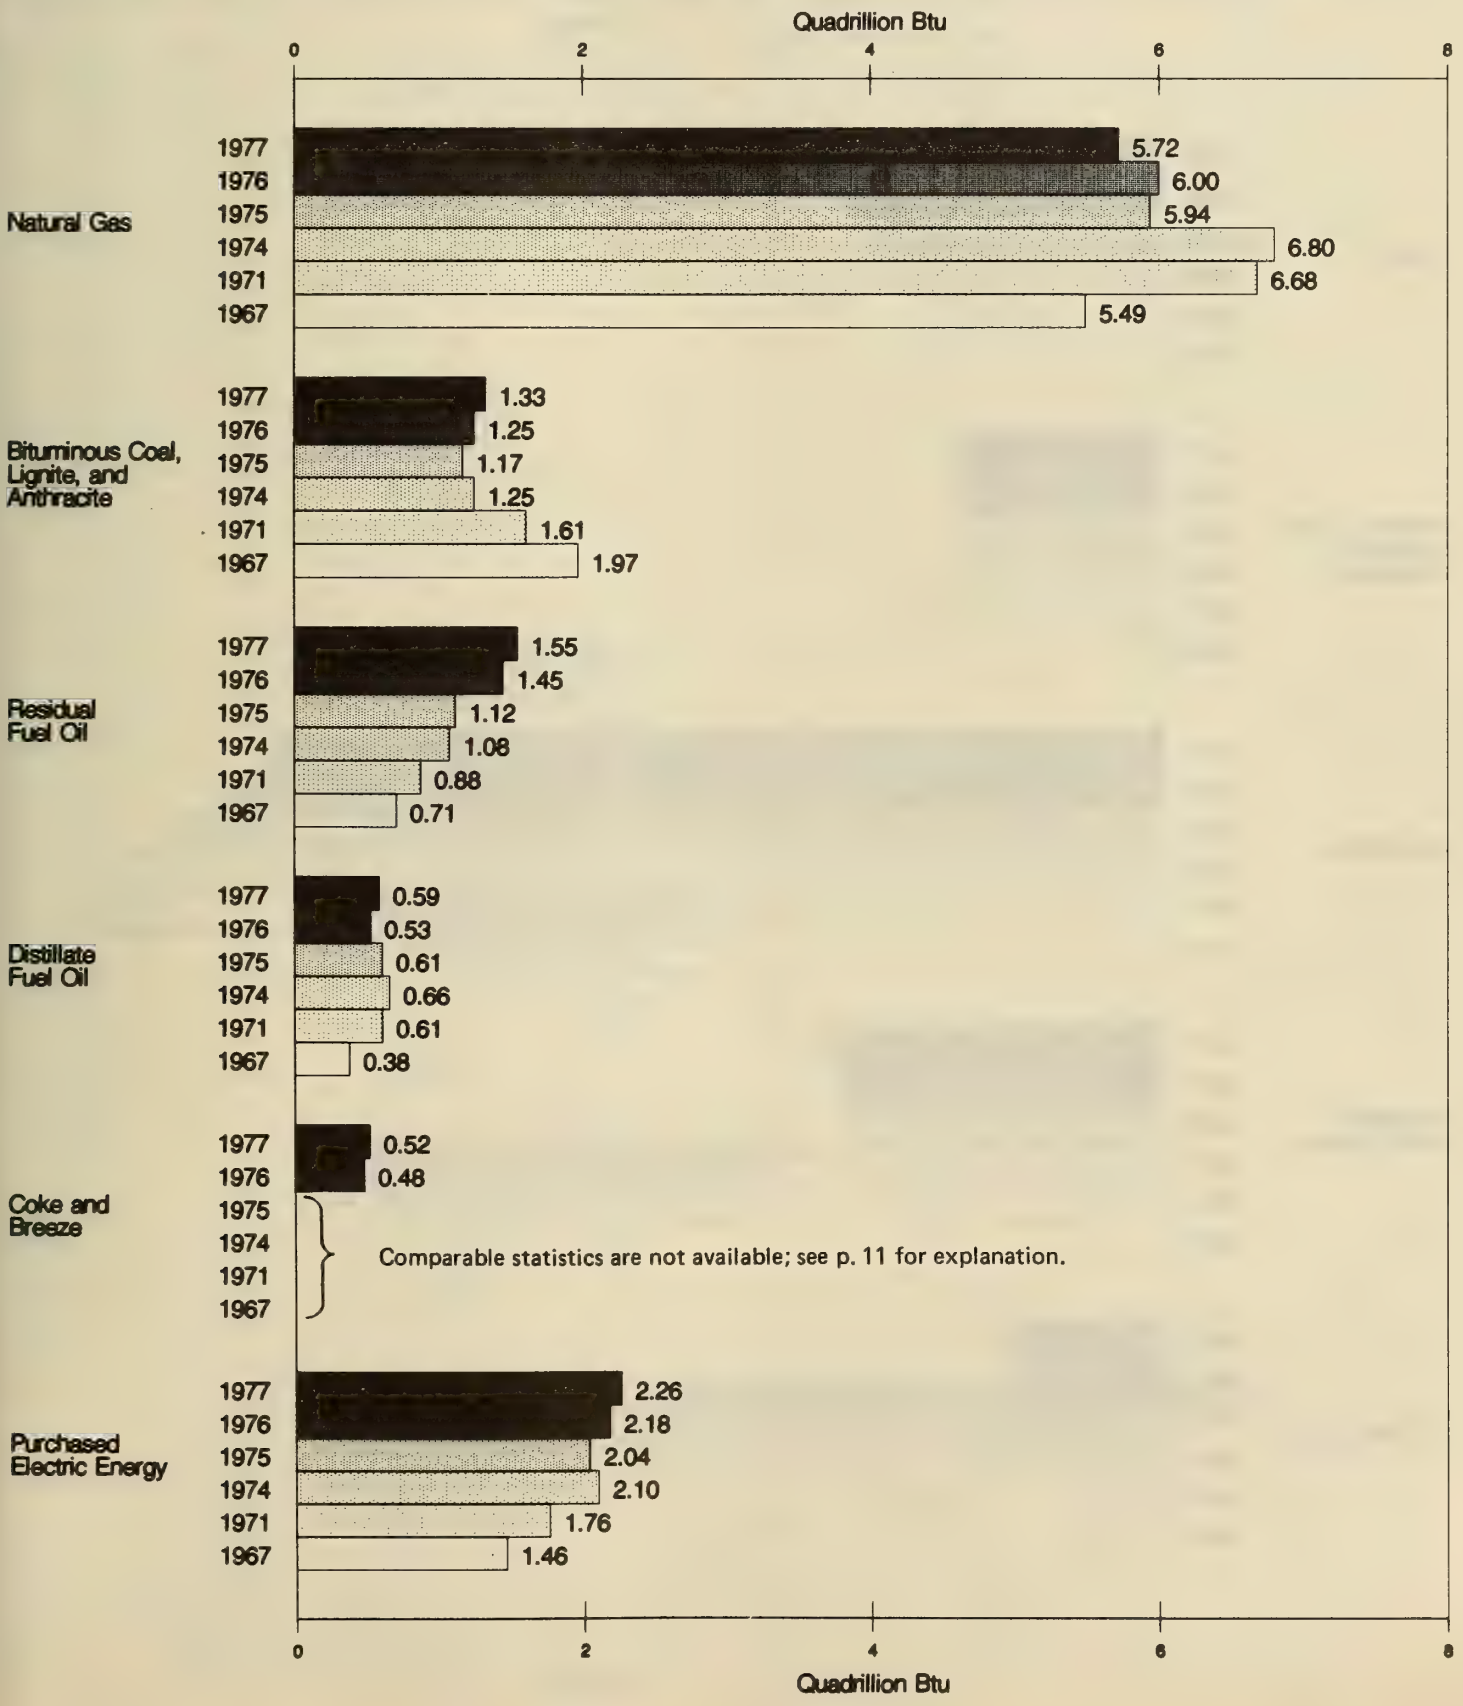

CHART 4.

Percent of Manufacturing Energy (BTU) Consumption Represented by Selected Individual Fuels and Purchased Electric Energy: 1967, 1971, and 1974–1977

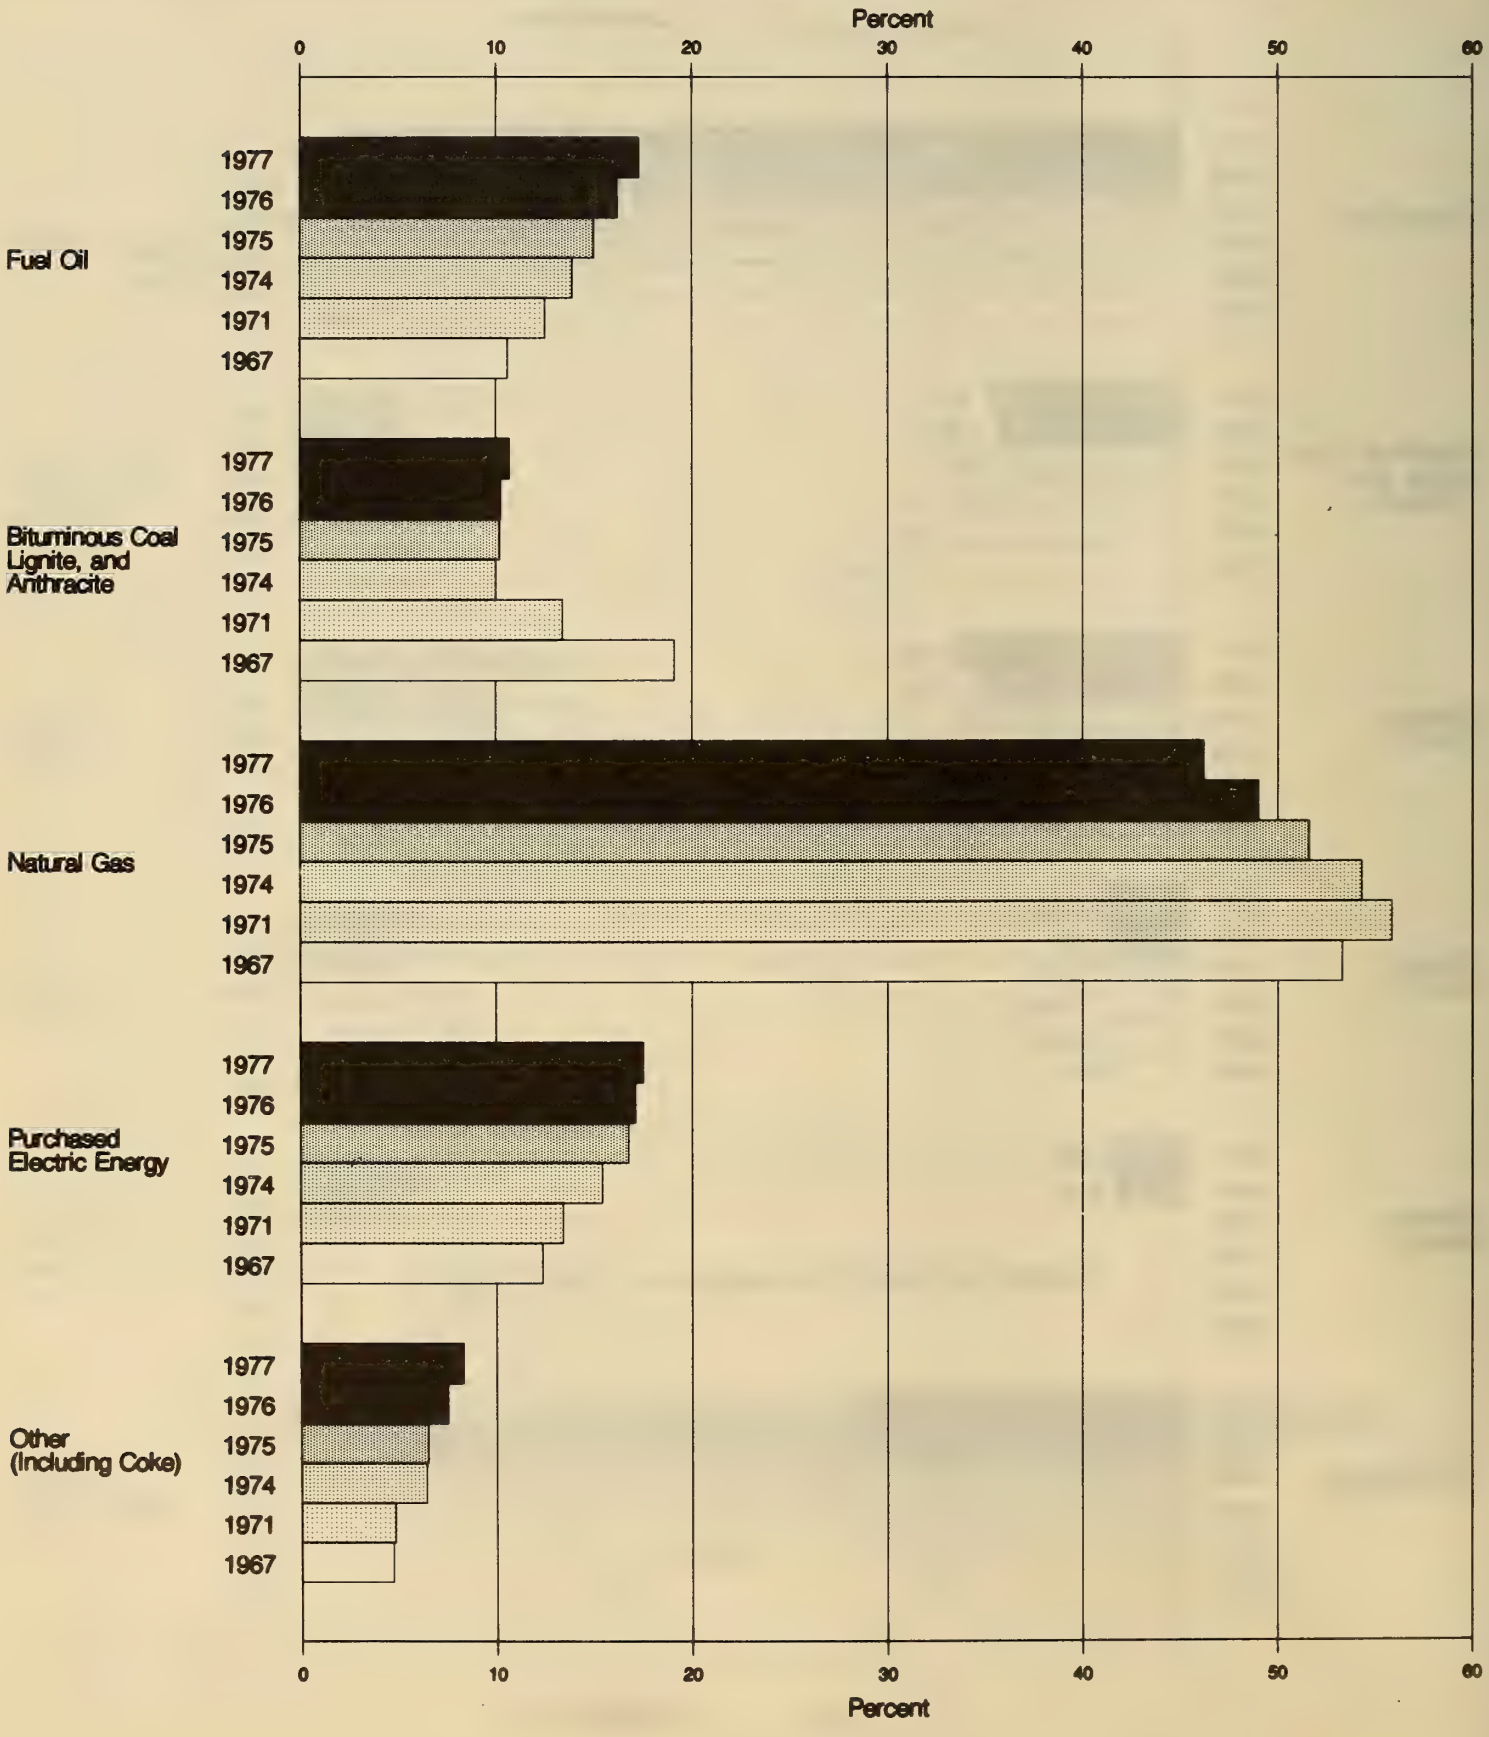

CHART 5.

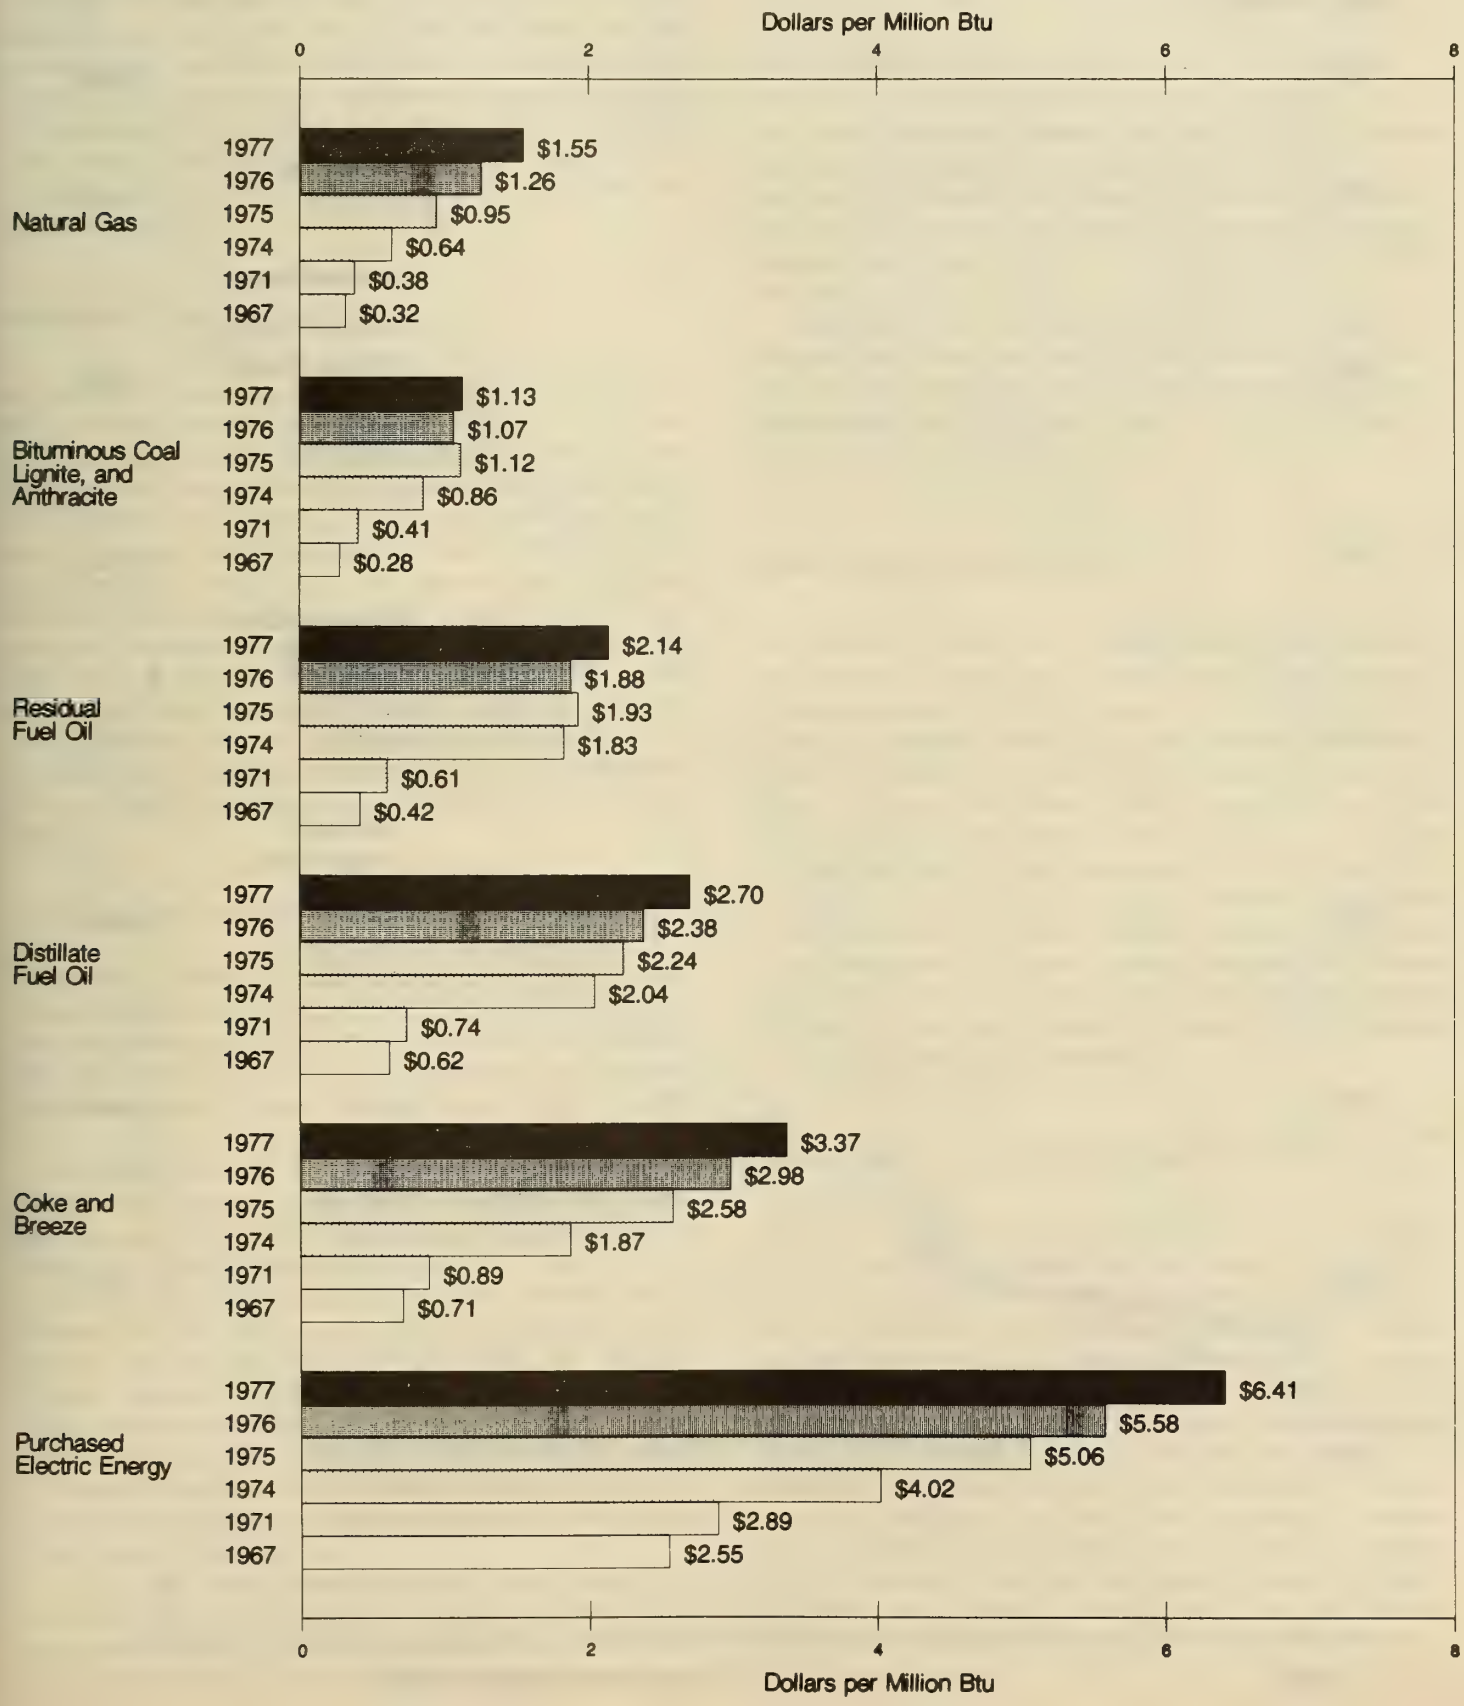
Cost per Million British Thermal Units of Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries: 1967, 1971, and 1974–1977

(Excludes Other Fuels and Fuels Not Specified by Kind, which for 1977 averaged $2.09 and $1.59 per million Btu's)



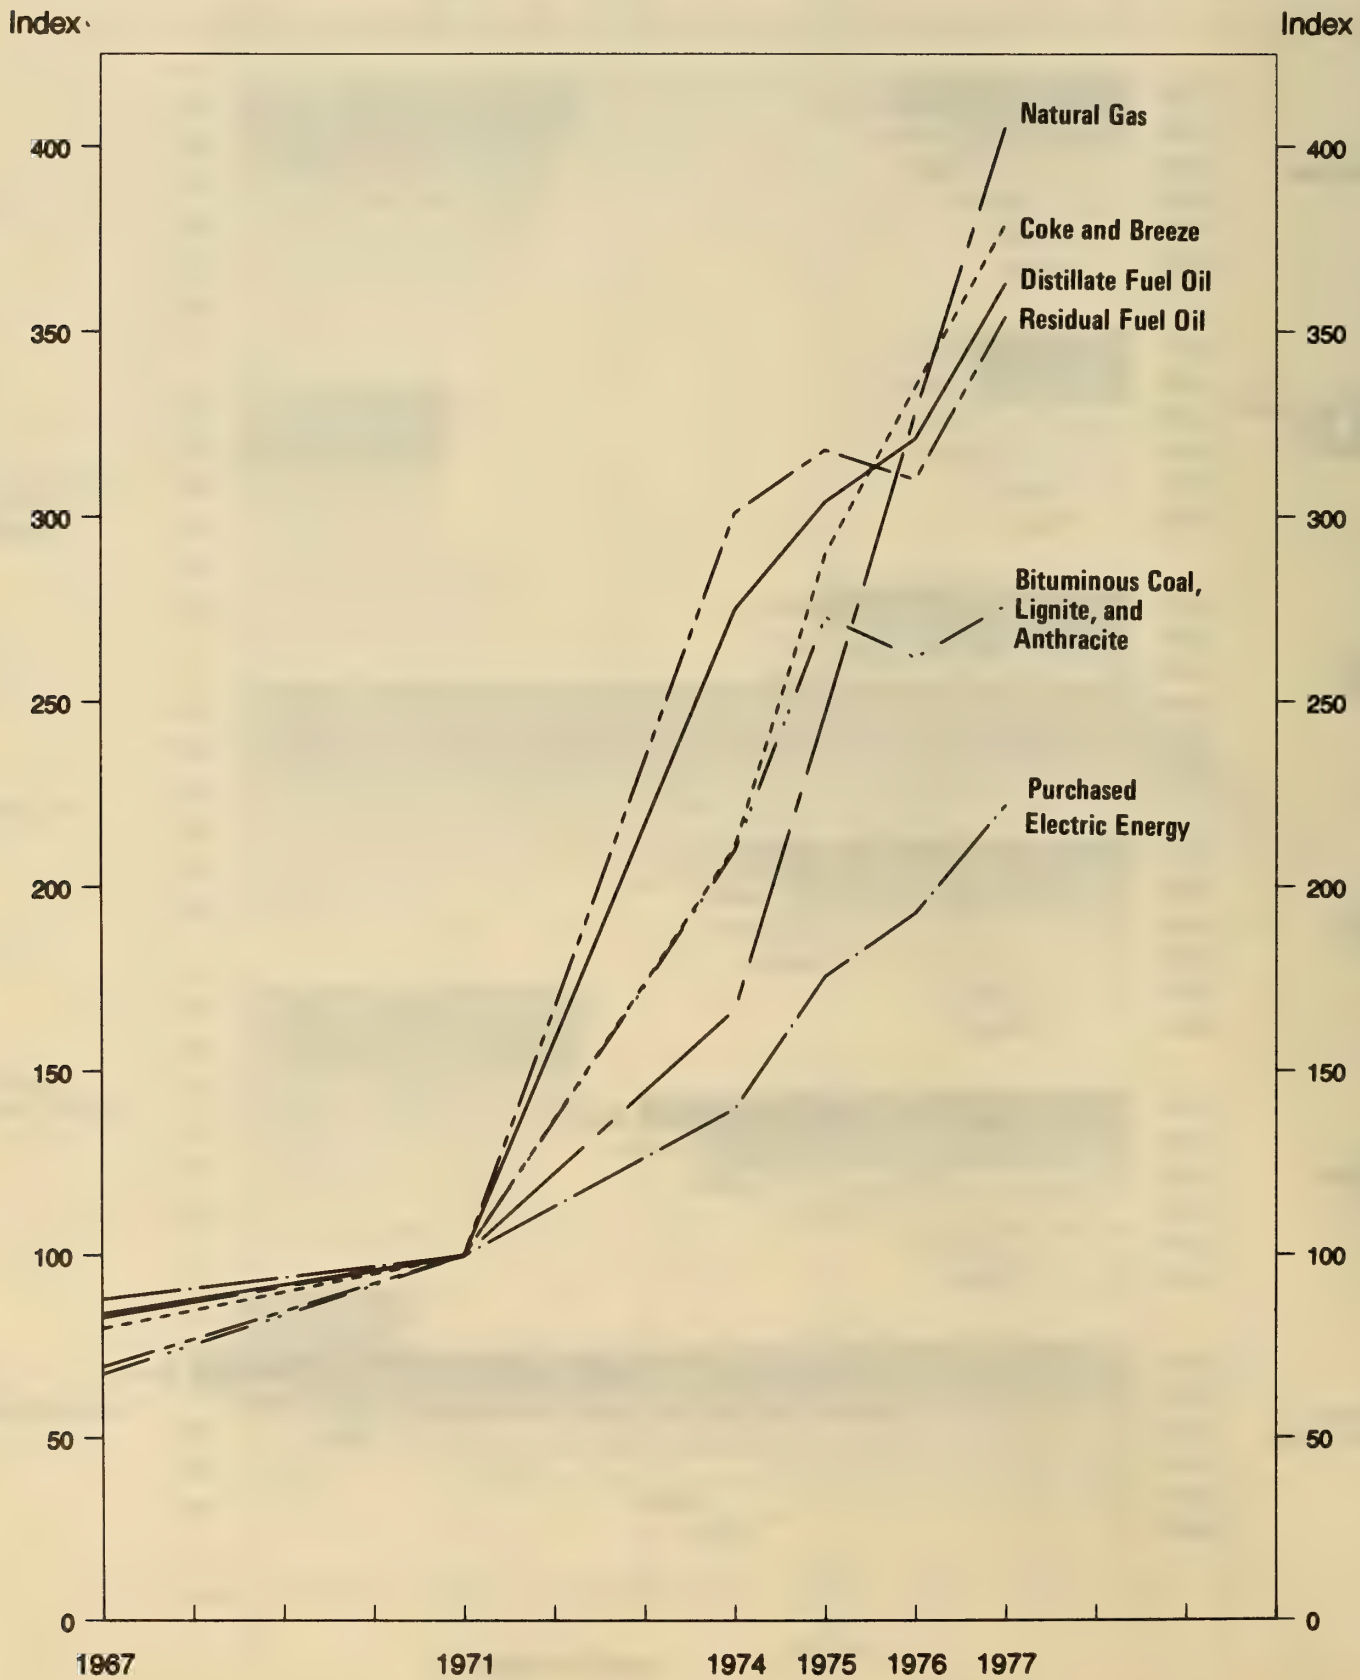


CHART 6.

Cost Per British Thermal Unit of Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries 1967, 1971, and 1974–1977 (1971=100)

STATE DATA

This report on fuels and electric energy consumed presents 1977 Census of Manufactures statistics on the quantity and cost of purchased fuels and electric energy for States by 2- and 3-digit standard industrial classification (SIC) industry groups. The data in this report supplement those previously published on this subject for the United States by industry groups and industries in publication series number MC77-SR-4 (Part 1). A subsequent report [MC77-SR-4 (Part 3)] will present final statistics for standard metropolitan statistical areas by major industry groups (2-digit SIC).

Consumption (Quantity of Btu's)

An increase in consumption of purchased fuels and electric energy occurred in most States between 1976 and 1977. At the individual State level, 34 States showed increases in consumption while 16 States and the District of Columbia recorded decreases. The largest absolute increases in consumption, from the 1976 level in trillions of Btu's were recorded by Pennsylvania (35.4), Louisiana (33.8), Illinois (30.5), and Alabama (12.1). Together these four States accounted for 22 percent of total consumption, and represented 73 percent of the increase in total usage. None of the percentage increases among the 20 largest consuming States exceeded 5 percent (table C). For the majority of the country, the increases can be attributed to increases in both purchased fuels and purchased electric energy with purchased fuels comprising the larger portion of the increase.

Cost of Fuel and Electric Energy

From 1976 to 1977, all States experienced an increase in the average cost per Btu of energy. The largest percentage increases were recorded by Kansas (30), New Mexico (29), and Oklahoma (28). The States with the smallest percentage increases were Nevada (less than 1), South Dakota (3), and Alaska (6) (table D).

The average cost per Btu for establishments in a State is dependent on the fuel mix as well as the cost of the various fuels consumed. No attempt has been made to standardize the State costs to adjust for differences in industry or fuel mix.

The 1977 unit cost of purchased energy for manufacturers in Louisiana ($1.34), Wyoming ($1.39), and Montana ($1.68) averaged less than $1.75 per million Btu's. At the other extreme, manufacturers in the District of Columbia, Rhode Island, Connecticut, and Vermont had an average cost in excess of $4.00 per million Btu's (table D). Chart 7 provides groupings of States categorized by the average unit costs paid by manufacturers for fuels, purchased electric energy, and the total of fuels plus electric energy.

Among the major energy-consuming States, there is a relationship between the types of industries which prevail in the higher cost States of Ohio and Pennsylvania versus the lower cost States of Texas and Louisiana. While the largest consuming industries in Texas and Louisiana are the nondurable chemical and petroleum refining industries (SIC Major Groups 28 and 29), the dominant energy-consuming industry in Ohio and Pennsylvania is primary metals (SIC Major Group 33).

Cost of Purchased Electric Energy

The largest percentage increases from 1976 to 1977 in the cost per Btu of purchased electric energy were recorded by manufacturers in Indiana (27 percent), California (26 percent), Montana (25 percent), and Oklahoma (25 percent). Plants in California and Hawaii recorded the highest absolute increases in unit cost.

Manufacturers in the Northwestern States of Washington, Montana, and Oregon maintained their positions as the lowest unit cost States while the New England States of Rhode Island, Massachusetts, and Connecticut had the highest unit costs for purchased electricity in 1977.

Major Energy-Consuming States

A significant amount of industrial energy consumption is concentrated in a few States. The 10 largest energy consuming States accounted for over 60 percent of the United States total (chart 8). Selected statistics for these 10 States are shown in chart 9. Included are the 1976 and 1977 consumption and cost per unit figures. Also shown is the percentage increase in cost per Btu equivalent between 1976 and 1977.

Manufacturers in Texas accounted for 14 percent of all purchased fuels and electric energy consumed in the manufacturing sector. After Texas, the largest consuming States were Ohio, Pennsylvania, Louisiana, Illinois, California, and Michigan, respectively (table C). These seven largest energy-consuming States accounted for 50 percent of the total energy consumed by manufacturers in the United States.

REVISIONS TO 1976 COKE AND BREEZE DATA

Data on the consumption of purchased coke and breeze before 1976 are not fully comparable with the data for 1976 and 1977.

During review of the 1977 Census of Manufactures data on the production and disposition of coke and breeze, it became evident that the amount of purchased coke consumed as a fuel was understated for some establishments. This occurred because some respondents misinterpreted instructions for reporting coke consumption. Correct 1977 data were obtained and the 1976 figures for purchased coke and breeze were adjusted to reflect the true consumption picture. These adjustments increased 1976 quantity and cost figures for coke and breeze (table E). It is not possible to develop comparable consumption figures for earlier years. However, the magnitude of the 1976 revisions gives a good indication of the probable impact on the 1974 and 1975 figures.

Table C. **Consumption and Cost for the Largest Energy-Consuming States, Ranked by 1977 Consumption: 1977 and 1976**

Rank	State	Consumption of purchased fuels and purchased electric energy			Cost of fuels and purchased electric energy					
					Total			Per million Btu's

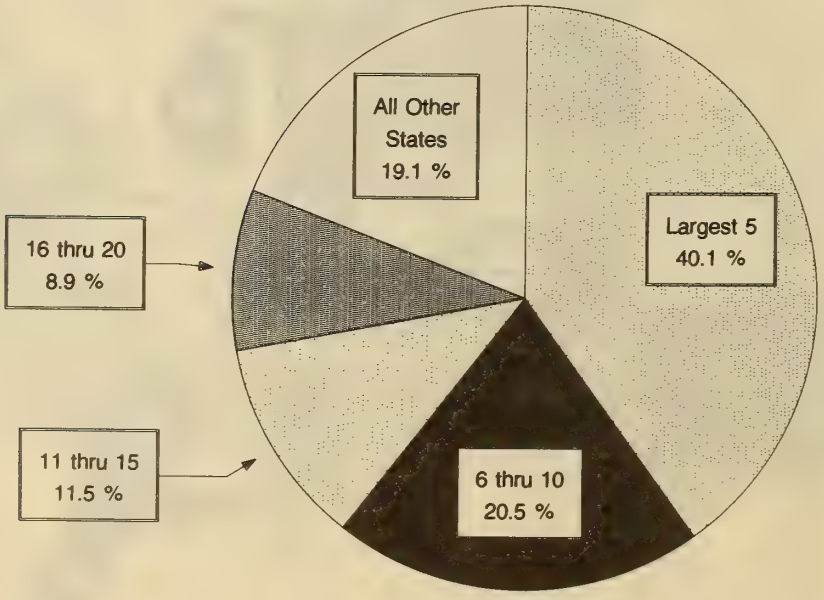

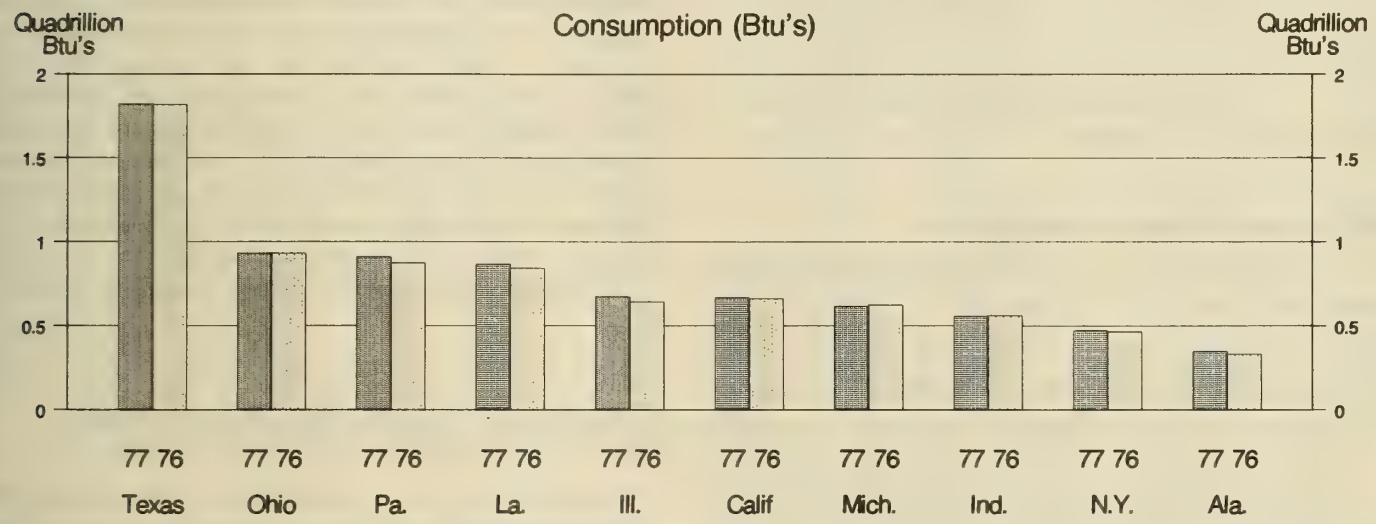

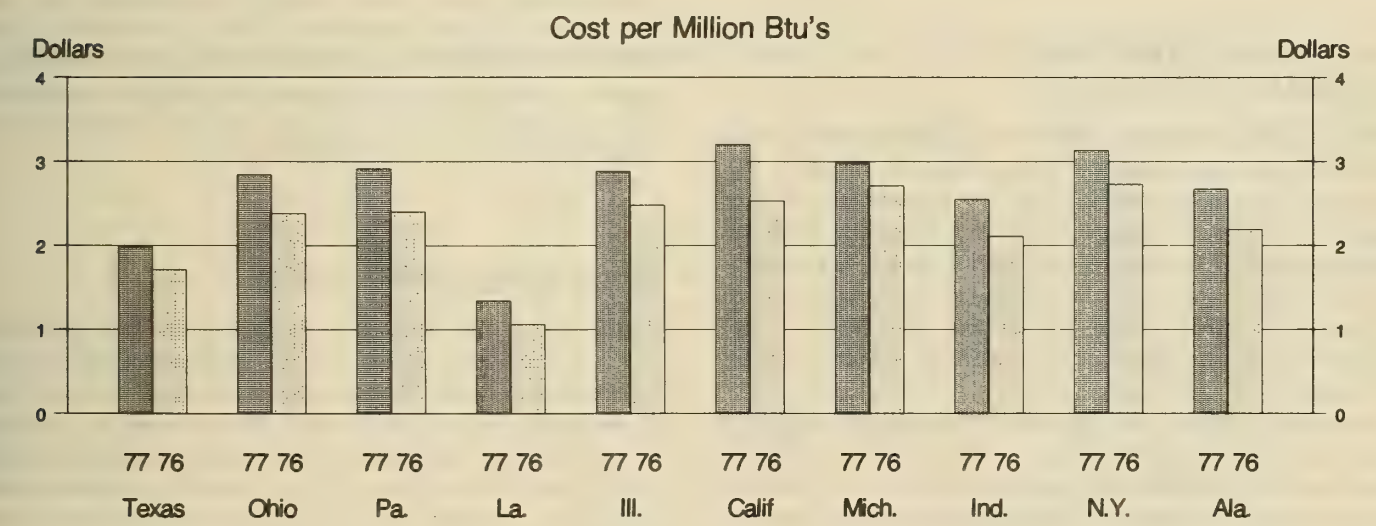

CHART 9.

Energy Consumption and Cost for the Ten Largest Energy-Consuming States: 1977 and 1976

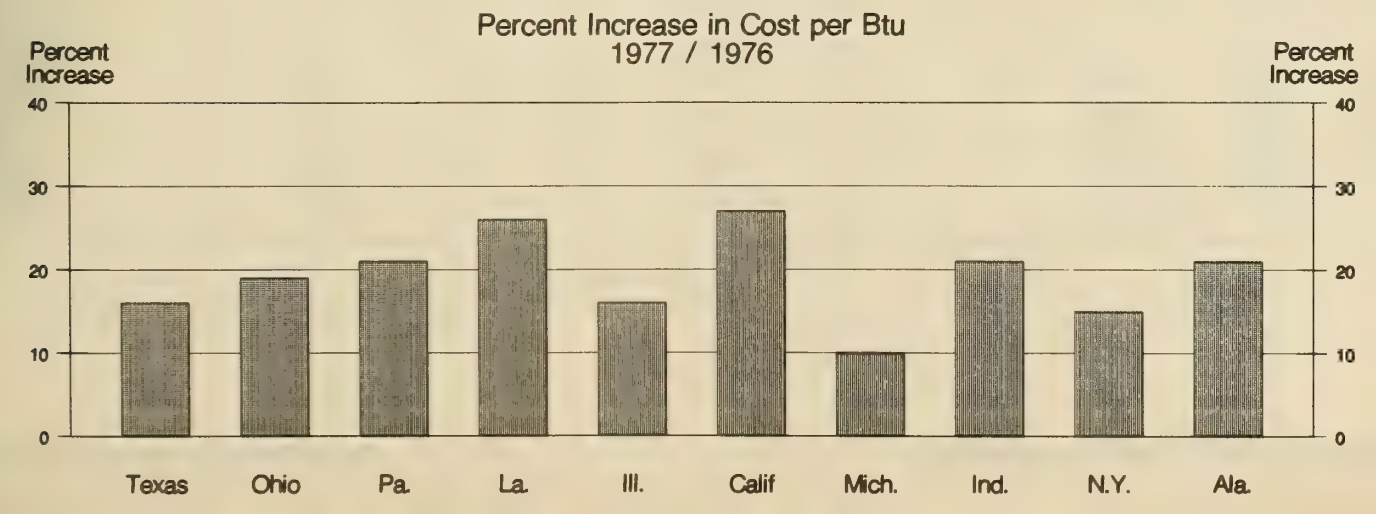

Table E. **Revisions to 1976 Coke and Breeze Statistics**

Fuel	Published 1976		Revised 1976	
	Quantity (1,000 s. tons)	Cost (mil. dol.)	Quantity (1,000 s. tons)	Cost (mil. dol.)
	All industries			
Coke and breeze.....	15,665.7	1,141.2	18,536.0	1,437.2
	Industry 3312, Blast furnaces and steel mills			
Coke and breeze.....	13,031.4	879.9	15,447.1	1,115.7

Table F. **Conversion to British Thermal Units: 1977**

Kind of energy	Unit of measure	Btu's (1,000)
Electric energy.	1,000 kWh	3,412
Coal	Short tons.	26,194
Coke	. . do.	25,993
Fuel oil:		
Distillate	Barrels (42-gal.) .	5,824
Residual	. . do.	6,285
Natural gas.	MCF (1,000 cu. ft.)	1,024
Other fuels.	Dollars	478

Note: For costs of "fuels, not specified by kind," conversion factors for 1977 were developed for each 2-digit SIC group, based on the relationship of total cost of fuels to the total kilowatt-hour equivalents for those groups, as published in M76(AS)-4.1, "Fuels and Electric Energy," 1976 Annual Survey of Manufactures.

CONVERSION TO BRITISH THERMAL UNITS (BTU'S)

Fuels consumed data were converted to British thermal units (BTU's) to provide comparable figures (table F). A Btu is the quantity of heat required to raise the temperature of one pound of water by 1 degree Fahrenheit. Btu factors reflect the energy content of the various fuels with no regard to efficiency of use. Since some fuel applications are considerably more efficient than others (none 100 percent efficient), the Btu figures must be considered as the maximum amount of available energy.

Beginning in 1976, the Btu rather than the kilowatt-hour equivalent was used as the common unit of measure for this statistical series. Several data users recommended the adoption of Btu's as the standard for energy quantification. There are 3,412 Btu's in one kilowatt-hour equivalent.

FUELS EXCLUDED FROM REPORT

Data on fuels produced and consumed in the same establishment, such as coke-oven gas or blast-furnaces gas; data on fuels used as raw materials, such as fuel oil and natural gas used to produce carbon black and crude petroleum used to produce fuels; and fuels converted to other fuel types, such as coal converted to coke, were not collected in the 1974, 1975, 1976, or 1977 surveys. As a result, significant amounts of energy materials used in manufacturing plants are not covered by this report. For example, in 1972 coke produced and consumed in SIC Industry 3312, Blast Furnaces and Steel Mills, amounted to 40.5 million short tons or 1.1 quadrillion Btu's. Inclusion of this coke would have increased the gross Btu's of fuels consumed by manufacturers by about 8 to 10 percent.

1972 AND 1977 REVISIONS TO STANDARD INDUSTRIAL CLASSIFICATION SYSTEM

A revised edition of the Standard Industrial Classification (SIC) manual was issued in 1972, the first major revision since 1957. In the 1972 version, extensive modifications were made in the manufacturing sector which affect comparability with the historic data in many industries. In 1977 a supplement to the 1972 SIC manual was issued presenting several minor additional changes to the classification system. More detailed descriptions of these changes are found in the 1972 and 1977 Census of Manufactures (MC72(1)-1 and MC77-SR-1).

CENSUS DISCLOSURE RULES

The Bureau of the Census is prohibited by law from publishing any statistics that would disclose information reported by individual companies. Additionally, quantity or cost data may be withheld if the figures do not meet publication standards on the basis of a consistency review. However, the total figures for a State, industry group, or major group include data for all component industries whether or not separate figures are shown for the individual industries comprising the total.

Table 1. Fuels and Electric Energy Used for Heat and Power: 1977 and Earlier Years

(For explanation of terms, see appendix A)

Year	Cost of purchased fuels and electric energy (million dollars)	Cost of purchased fuels (million dollars)	Electric energy: Purchased: Quantity (million kWh)	Electric energy: Purchased: Cost (million dollars)	Electric energy: Generated less sold (million kWh)

- Represents zero.
[1]Data are revised because of adjustments to estimating technique; see appendix G, Revised Method of Estimation, for explanation of changes to 1976 data. A comparable adjustment with 1972 as the base was used to revise 1974 and 1975 data.
[2]Figures for residual fuel oil are included with distillate fuel oil.
[3]Figure includes manufactured, still, blast-furnace, and coke-oven gas.
[4]Figure includes gas, except natural gas.

Table 3. Fuels and Electric Energy Used for Heat and Power for States by Industry Group and Fuel Type: 1977 and Revised 1976

Note: Data presented in this table supersede 1976 published data. Data were revised as a result of adjustments to estimating technique. For a complete discussion of these adjustments see appendix C, Revised Method of Estimation.

- Represents zero. (D) Withheld to avoid disclosing figures for individual companies. (S) Withheld because the estimate did not meet publication standards, either on the basis of the associated standard error of the estimate or on the basis of a consistency review. (X) Not applicable. (Z) Less than half of the unit of measure specified.

[1]Standard error of estimate is described in appendix B. Cost of fuels (col. D) and purchased electric energy (col. Q and R) were collected from all establishments in the 1977 Census of Manufactures. The figures shown for these items are census totals; therefore, sampling standard errors do not apply. Standard errors of estimates for the cost of coke for the 43 States that reported this fuel and standard errors of estimates for "other fuels" are not shown in this table. Standard errors for "other fuels" are generally higher, and may sometimes be considerably higher than those for specified kinds of fuels for which standard errors of estimates are shown. Standard error for cost of coke consumed is less than 1 percent at "all industries" level.

Table 4. Selected Fuels and Electric Energy Statistics for States by Industry Group: 1976 Revised

(Data are revised because of adjustments to estimating techniques; see appendix G, Description of Survey Sample. For explanation of terms, see appendix A)

SIC code	State and industry group	Purchased fuels and electric energy		Purchased fuels		Fuels not specified by kind (million dollars)	Electric energy			Standard error of estimate (percent) for columns[1]	
							Purchased		Generated less sold (million kWh)

STANDARD METROPOLITAN STATISTICAL

U.S. DEPARTMENT OF COMMERCE

AREAS OF THE UNITED STATES

EXPLANATORY TEXT

SUMMARY DATA

In 1977 the U.S. consumption of purchased fuels and electric energy for heat and power by manufacturing establishments totaled 12.9 quadrillion British thermal units (Btu's). This represented a 1 percent increase over the 1976 consumption figure of 12.8 quadrillion Btu's, which was considerably lower than the 6.2 percent increase in the Federal Reserve Board's (FRB) index of manufacturing production for that period. From these statistics it appears that proportionately less energy is being consumed in the production of manufactured goods. Apparently, fuel shortages and resulting efforts to save energy have changed the historic correlation between levels of production and energy consumption.

Expenditures during 1977 by manufacturers for fuels and electric energy amounted to $33.4 billion, an increase of 19 percent over the 1976 total of $28.1 billion (chart 1). Manufacturers' expenditures in 1977 for natural gas totaled $8.9 billion, an 18 percent increase over the 1976 level of $7.5 billion. Purchased electric energy costs increased 19 percent from $12.2 billion in 1976 to $14.5 billion in 1977, while those for fuel oil increased 23 percent to a 1977 level of $4.9 billion. Expenditures for coal increased by 11 percent between 1976 and 1977 to $1.5 billion, while for coke and breeze they increased 22 percent from the revised 1976 figure of $1.4 billion to $1.8 billion in 1977 (chart 2). All dollar figures in this report are in current dollars and therefore are not adjusted for changes in price levels.

While overall energy consumption between 1976 and 1977 showed only a modest increase, some variations in the mix of the fuel types and electric energy occured (chart 3). Increases in consumption were recorded for each of the major fuels and purchased electric energy except natural gas. Consumption of gas declined 5 percent from the 1976 level. This decrease caused the proportion of total natural gas consumed to slide to 46 percent of all manufacturing energy usage during 1977. Although natural gas remains the dominant fuel used by manufacturers, its percent of total energy usage has dropped significantly from the 1971 level of 56 percent. This shows the increasing switch from natural gas to the other major fuels and electric energy, particularly to residual fuel oil (table A and chart 4).

The average cost per million Btu's of energy consumed in 1977 was $2.58, a 17 percent increase over the 1976 average cost. This increase, more than the 14 percent increase between 1975 and 1976, was considerably lower than the average annual increase of 25 percent between 1971 and 1975. The increased average cost per million Btu's resulted primarily from an increased unit cost of natural gas, which rose to $1.55 per million Btu's. This was a 24 percent jump over the 1976 average cost of $1.26 per million Btu's. Lesser increases in average unit cost were registered by each of the other major fuels and electric energy. Again in 1977, coal remained the lowest cost fuel (on a Btu-per-dollar basis) of any of the major fuels covered in this report (table B and chart 5). Chart 6 illustrates the sharp increase in unit costs of selected fuels and electric energy consumed by all manufacturing industries during 1967-1977.

Although purchased electric energy accounted for 17 percent of the total energy consumed by manufacturers, it accounted for 43 percent of total energy expenditures. While natural gas accounted for 46 percent of total energy used (chart 4), it accounted for only 27 percent of total expenditures, making it a considerably lower priced source of energy than electricity in terms of Btu's. This Btu computation assumes perfect conversion of various fuels into energy, which in practice does not occur. Thus, a decrease in fuel consumption with a corresponding increase in purchased electric energy will result in a lower Btu figure to the extent that conversion losses are shifted to a public utility.

Table A. **Percent of Total Energy Consumed by All Manufacturing Industries for Selected Fuels and Purchased Electric Energy: 1967, 1971, and 1974-1977**

(Data for fuels not specified by kind were distributed among detailed fuels)

Cost Per British Thermal Unit of Selected Fuels and Purchased Electric Energy Consumed by All Manufacturing Industries 1967, 1971, and 1974–1977 (1971=100)

STANDARD METROPOLITAN STATISTICAL AREA DATA

During 1977, the trend in energy usage and prices paid by manufacturing establishments in the 277 standard metropolitan statistical areas (SMSA'S)[1] covered by this report was an upward one. As compared to 1976, establishments in these SMSA's consumed 2 percent more energy and paid a unit cost which was approximately 17 percent higher. Consumption and unit prices increased from 1976 for the group of the 20 biggest energy users among the SMSA's, the next 40 largest, and for the group of other SMSA's as well (table C).

For the United States as a whole, energy consumption rose by 152.7 trillion Btu's and SMSA's accounted for 134.9 trillion Btu's of this increase, or just over 88 percent. The 10 largest energy-consuming SMSA's contributed 47.9 trillion Btu's, or nearly 32 percent, of the total U.S. increase. The average unit cost per million Btu's of energy consumed by all SMSA's rose to $2.63 in 1977, nearly 2 percent above the U.S. average. This 17 percent increase in unit cost for all SMSA's was identical to the percentage increase experienced in non-SMSA areas.

Energy Cost and Usage Trends for the Larger Energy Consuming Metropolitan Areas

Manufacturing establishments located in the top 60 energy-using SMSA's in the United States accounted for 50 percent of the total U.S. consumption of fuels and electric energy and 49 percent of the total cost paid for energy by U.S. manufacturing establishments. Their unit cost of $2.52 per million Btu's was 2 percent below the national average.

A substantial range in unit cost paid for energy existed within the top 60 energy-using SMSA's. Establishments in Longview, Texas, paid $.71 per million Btu's, as opposed to $4.36 in New York (table D). In general, southern SMSA's tended to pay less for energy than those in the Northeast. The primary reason for the wide variation in unit cost was differences in proportions of purchased fuels and electric energy used. For instance, Longview establishments purchased 94 percent of their energy as natural gas, as opposed to less than 16 percent for New York establishments. Electric energy, distillate fuel oil, and residual fuel oil, more expensive energy types, combined to meet approximately 51 percent of New York's energy needs. New York manufacturers paid an average price of $11.87 per million Btu's for its electric energy, and more than $2.50 each for distillate ($2.85) and residual ($2.52) fuel oils, while Longview's paid a unit price of $.42 for natural gas. Establishments in New York paid $2.16 per million Btu's for natural gas, substantially higher than Longview but well below the prices it paid for electric energy and fuel oils.

This specific case is a good example of what holds true throughout the top 60 metropolitan areas. Those areas where natural gas accounted for a majority of fuel consumption paid a much lower cost per million Btu's than those in which the use of purchased electric energy and fuel oil predominated.

The 20 largest energy consuming SMSA's accounted for 34 percent of the U.S. total for fuel and electric energy consumption, the same percentage as in 1976. Again in 1977, Houston was the largest energy-consuming SMSA with a consumption of 715.5 trillion Btu's of energy. Houston was followed by Chicago (366.4 trillion Btu's) and Pittsburgh (361.3 trillion Btu's) as the largest energy-consuming SMSA's (table E). The unit cost of $2.52 per million Btu's for the largest 20 SMSA's was slightly below the national average of $2.58. The top 10 SMSA's accounted for 25 percent of total fuel consumption in the United States, and 35 percent of total fuel consumption of all SMSA's, showing the domination of the larger SMSA's within the top 20.

Among the top 20 SMSA's, three were in Texas, and three in Louisiana. Due to the abundance of natural gas fields in the Gulf Coast area, all six were able to use large proportions of natural gas to meet their energy needs, and they all paid a unit cost of at least 18 percent below the national average for their energy needs. Two major industry groups, Chemicals and Allied Products, and Petroleum and Coal Products, accounted for a major portion of the energy usage in these six SMSA's.

Los Angeles stands out among the top energy-using SMSA's, paying the highest unit cost outside of those SMSA's in the Northeast. This high unit cost arises from Los Angeles using purchased electric energy to meet nearly one quarter of its energy needs.

REVISIONS TO 1976 COKE AND BREEZE DATA

Data on the consumption of purchased coke and breeze before 1976 are not fully comparable with the data for 1976 and 1977,

During review of the 1977 Census of Manufactures data on the production and disposition of coke and breeze, it became evident that the amount of purchased coke consumed as a fuel was understated for some establishments. This occurred because some respondents misinterpreted instructions for reporting coke consumption. Correct 1977 data were obtained and the 1976 figures for purchased coke and breeze were adjusted to reflect the true consumption picture. These adjustments increased 1976 quantity and cost figures for coke and breeze (table F). It is not possible to develop comparable consumption figures for earlier years. However, the magnitude of the 1976 revisions gives a good indication of the probable impact on the 1974 and 1975 figures.

[1] **Standard Metropolitan Statistical Areas**—A standard metropolitan statistical area is an integrated economic and social unit with a recognized large population nucleus. Each standard metropolitan statistical area consists of one or more entire counties which meet standards pertaining to population and metropolitan character. In New England, where towns rather than counties are used as the basic geographic unit for statistical compilations, standard metropolitan statistical areas are defined on a town rather than a county basis. Census Divisions are used for defining standard metropolitan statistical areas in the State of Alaska.

Chart 7.

Energy Consumption for the Largest Energy-Consuming Metropolitan Areas as a Percentage of the Total Energy Consumption by Manufactures in the United States: 1977

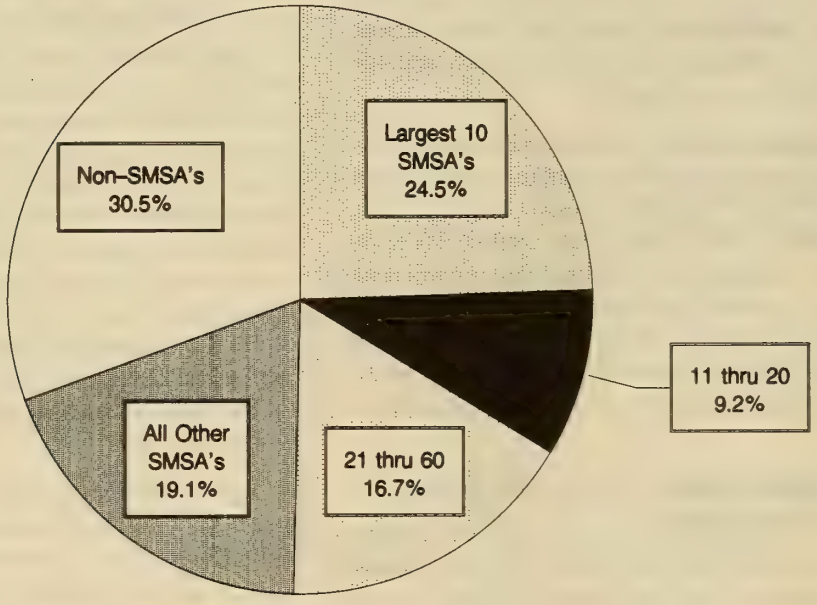

Table C. **Energy Consumption and Cost for Selected Standard Metropolitan Statistical Areas: 1977 and 1976**

Area	Purchased fuels and electric energy				Cost per million Btu's (dollars)	
	Btu consumption (trillions)		Total cost (million dollars)			
	1977	1976	1977	1976	1977	1976

(D) Withheld to avoid disclosing figures for individual companies.

Table F. **Revisions to 1976 Coke and Breeze Statistics**

Fuel	Published 1976		Revised 1976	
	Quantity (1,000 s. tons)	Cost (mil. dol.)	Quantity (1,000 s. tons)	Cost (mil. dol.)
	All industries			
Coke and breeze.....	15,665.7	1,141.2	18,536.0	1,437.2
	Industry 3312, Blast furnaces and steel mills			
Coke and breeze.....	13,031.4	879.9	15,447.1	1,115.7

Table G. **Conversion to British Thermal Units: 1977**

Kind of energy	Unit of measure	Btu's (1,000)
Electric energy.	1,000 kWh	3,412
Coal	Short tons.	26,194
Coke	. . do.	25,993
Fuel oil:		
Distillate	Barrels (42-gal.) .	5,824
Residual	. . do.	6,285
Natural gas.	MCF (1,000 cu. ft.)	1,024
Other fuels.	Dollars	478

Note: For costs of "fuels, not specified by kind," conversion factors for 1977 were developed for each 2-digit SIC group, based on the relationship of total cost of fuels to the total kilowatt-hour equivalents for those groups, as published in M76(AS)-4.1, "Fuels and Electric Energy," 1976 Annual Survey of Manufactures.

CONVERSION TO BRITISH THERMAL UNITS (BTU'S)

Fuels consumed data were converted to British thermal units (BTU's) to provide comparable figures (table G). A Btu is the quantity of heat required to raise the temperature of one pound of water by 1 degree Fahrenheit. Btu factors reflect the energy content of the various fuels with no regard to efficiency of use. Since some fuel applications are considerably more efficient than others (none 100 percent efficient), the Btu figures must be considered as the maximum amount of available energy.

Beginning in 1976, the Btu rather than the kilowatt-hour equivalent was used as the common unit of measure for this statistical series. Several data users recommended the adoption of Btu's as the standard for energy quantification. There are 3,412 Btu's in one kilowatt-hour equivalent.

FUELS EXCLUDED FROM REPORT

Data on fuels produced and consumed in the same establishment, such as coke-oven gas or blast-furnaces gas; data on fuels used as raw materials, such as fuel oil and natural gas used to produce carbon black and crude petroleum used to produce fuels; and fuels converted to other fuel types, such as coal converted to coke, were not collected in the 1974, 1975, 1976, or 1977 surveys. As a result, significant amounts of energy materials used in manufacturing plants are not covered by this report. For example, in 1972 coke produced and consumed in SIC Industry 3312, Blast Furnaces and Steel Mills, amounted to 40.5 million short tons or 1.1 quadrillion Btu's. Inclusion of this coke would have increased the gross Btu's of fuels consumed by manufacturers by about 8 to 10 percent.

1972 AND 1977 REVISIONS TO STANDARD INDUSTRIAL CLASSIFICATION SYSTEM

A revised edition of the Standard Industrial Classification (SIC) manual was issued in 1972, the first major revision since 1957. In the 1972 version, extensive modifications were made in the manufacturing sector which affect comparability with the historic data in many industries. In 1977 a supplement to the 1972 SIC manual was issued presenting several minor additional changes to the classification system. More detailed descriptions of these changes are found in the 1972 and 1977 Census of Manufactures volumes, in the introduction.

CENSUS DISCLOSURE RULES

The Bureau of the Census is prohibited by law from publishing any statistics that would disclose information reported by individual companies. Additionally, quantity or cost data may be withheld if the figures do not meet publication standards on the basis of a consistency review. However, the total figures for a State, industry group, or major group include data for all component industries whether or not separate figures are shown for the individual industries comprising the total.

Table 1. Fuels and Electric Energy Used for Heat and Power: 1977 and Earlier Years

(For explanation of terms, see appendix A)

Year	Cost of purchased fuels and electric energy (million dollars)	Cost of purchased fuels (million dollars)	Electric energy		
			Purchased		Generated less sold (million kWh)
			Quantity (million kWh)	Cost (million dollars)	
1977	33,379.6	18,864.7	663,351.0	14,515.1	63,194.2
1976[1]	28,138.5	15,959.5	640,164.6	12,179.1	63,843.9
1975[1]	23,290.7	12,977.8	596,798.0	10,312.9	63,275.0
1974[1]	19,468.3	11,003.0	616,665.1	8,465.3	80,932.3
1973[1]	13,625.5	7,012.3	612,601.5	6,613.2	84,864.7
1972	11,771.7	6,055.9	557,468.9	5,715.8	87,185.7
1971	10,432.1	5,360.6	514,612.7	5,070.6	82,828.0
1970	9,424.7	4,845.7	500,768.7	4,579.2	83,327.3
1969	8,751.4	4,456.6	497,015.7	4,294.8	83,351.7
1968	8,272.1	4,263.0	458,908.4	4,009.1	82,752.2
1967	7,691.7	3,974.9	427,465.1	3,716.8	78,355.8
1966	7,365.9	3,902.3	399,390.0	3,463.6	80,500.0
1965	6,973.4	3,727.3	373,428.0	3,246.1	80,453.0
1964	6,706.6	3,583.9	357,292.0	3,122.7	79,740.0
1963	6,369.7	3,409.0	333,512.0	2,960.7	72,949.0
1962	6,184.0	3,360.7	313,961.0	2,823.3	74,261.0
1961	5,825.3	3,192.6	298,325.0	2,632.7	68,533.0
1960	5,765.1	3,192.9	291,949.0	2,572.2	70,016.0
1959	5,544.6	3,082.7	281,301.0	2,461.9	69,291.0
1958	5,067.0	2,836.2	252,909.0	2,230.8	66,850.0

[1]Data are revised because of adjustments to estimating technique; see appendix G, Revised Method of Estimation, for explanation of changes to 1976 data. A comparable adjustment with 1972 as the base was used to revise 1973, 1974, and 1975 data.

Table 2. Quantity and Cost of Purchased Fuels and Electric Energy Used for Heat and Power: 1977 and Selected Earlier Years

(For explanation of terms, see appendix A)

Year	Purchased fuels and electric energy		Purchased fuels		Fuel oil				Bituminous coal, lignite, and anthracite	
					Distillate		Residual			
	British thermal units (trillions)	Cost (million dollars)	British thermal units (trillions)	Cost (million dollars)	Quantity (1,000 barrels)	Cost (million dollars)	Quantity (1,000 barrels)	Cost (million dollars)	Quantity (1,000 short tons)	Cost (million dollars)

- Represents zero.
[1]Data are revised because of adjustments to estimating technique; see appendix G, Revised Method of Estimation, for explanation of changes to 1976 data. A comparable adjustment with 1972 as the base was used to revise 1974 and 1975 data.
[2]Figures for residual fuel oil are included with distillate fuel oil.
[3]Figure includes manufactured, still, blast-furnace, and coke-oven gas.
[4]Figure includes gas, except natural gas.

Table 3. **Fuels and Electric Energy Used for Heat and Power for Standard Metropolitan Statistical Areas by Major Industry Group and Fuel Type: 1977 and Revised 1976**

(For explanation of terms, see appendix A)
